9^{th} International Workshop on: "Neutrino Telescopes"

March 6-9, 2001

"Istituto Veneto di Scienze, Lettere ed Arti" - Campo S.Stefano 2945
Venice

Gravitational Waves
Laser Interferometric Detectors

Barry Barish

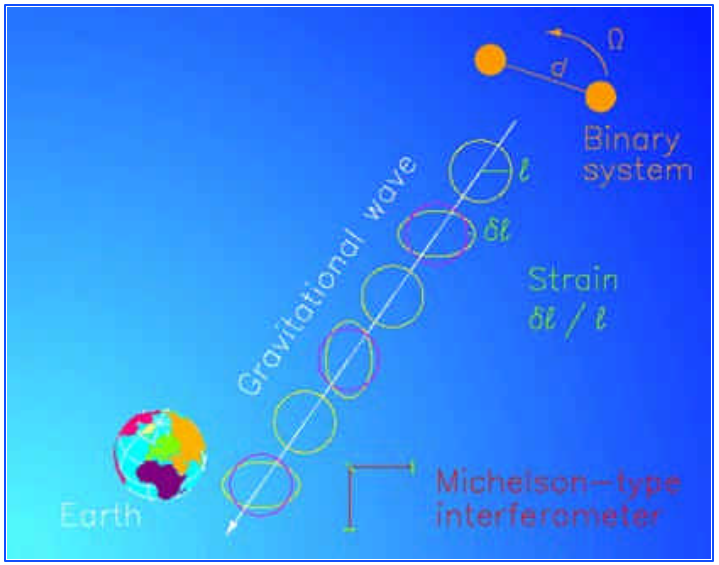
7 March 2001

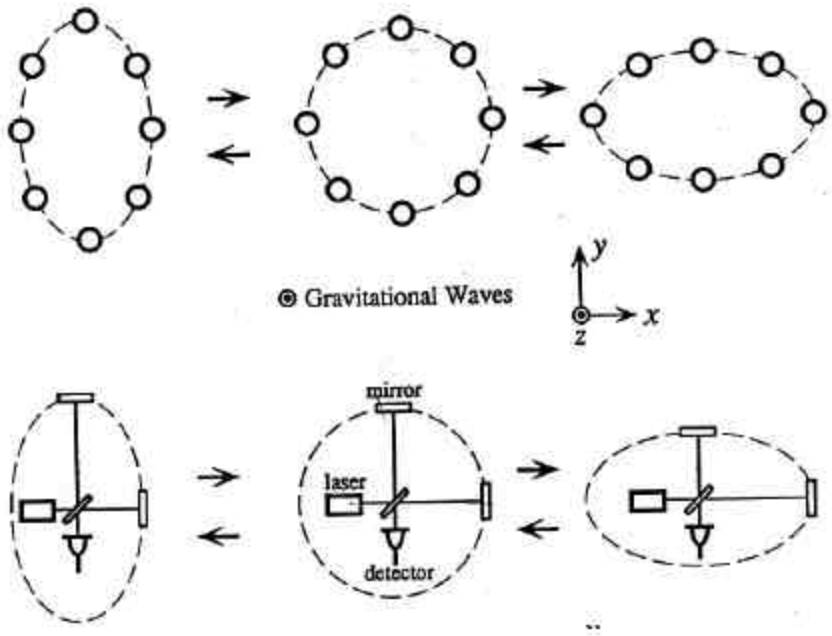
Interferometers

terrestrial

Suspended mass Michelson-type interferometers on earth's surface detect distant astrophysical sources

International network (LIGO, Virgo, GEO, TAMA) enable locating sources and decomposing polarization of gravitational waves.

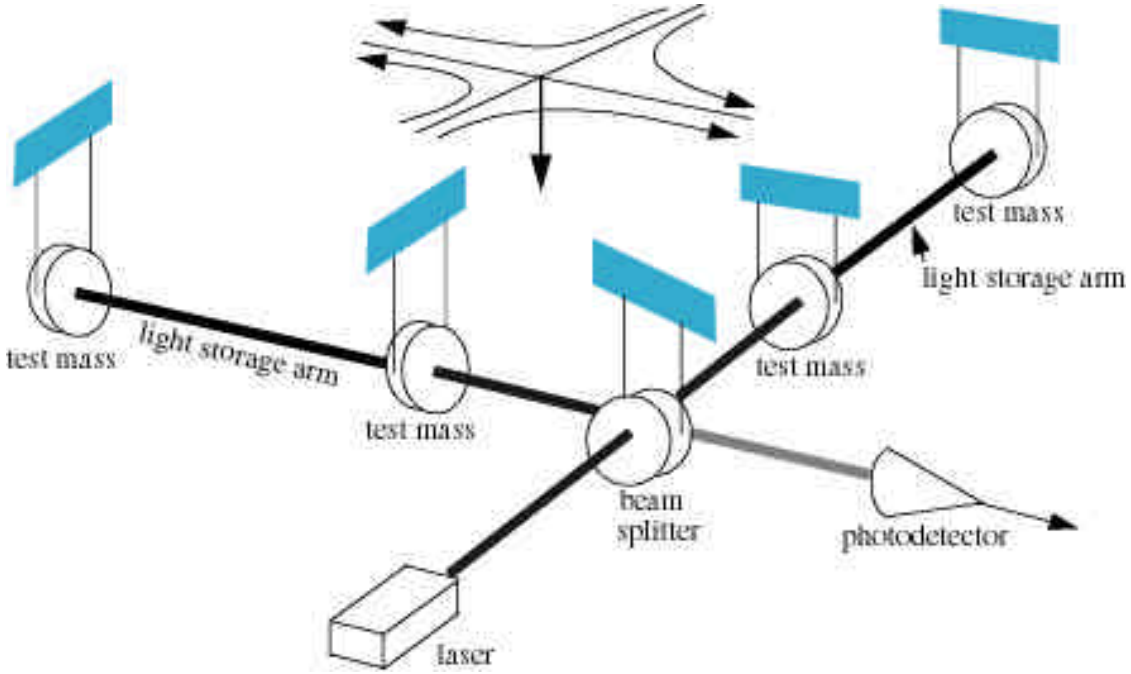




Interferometers

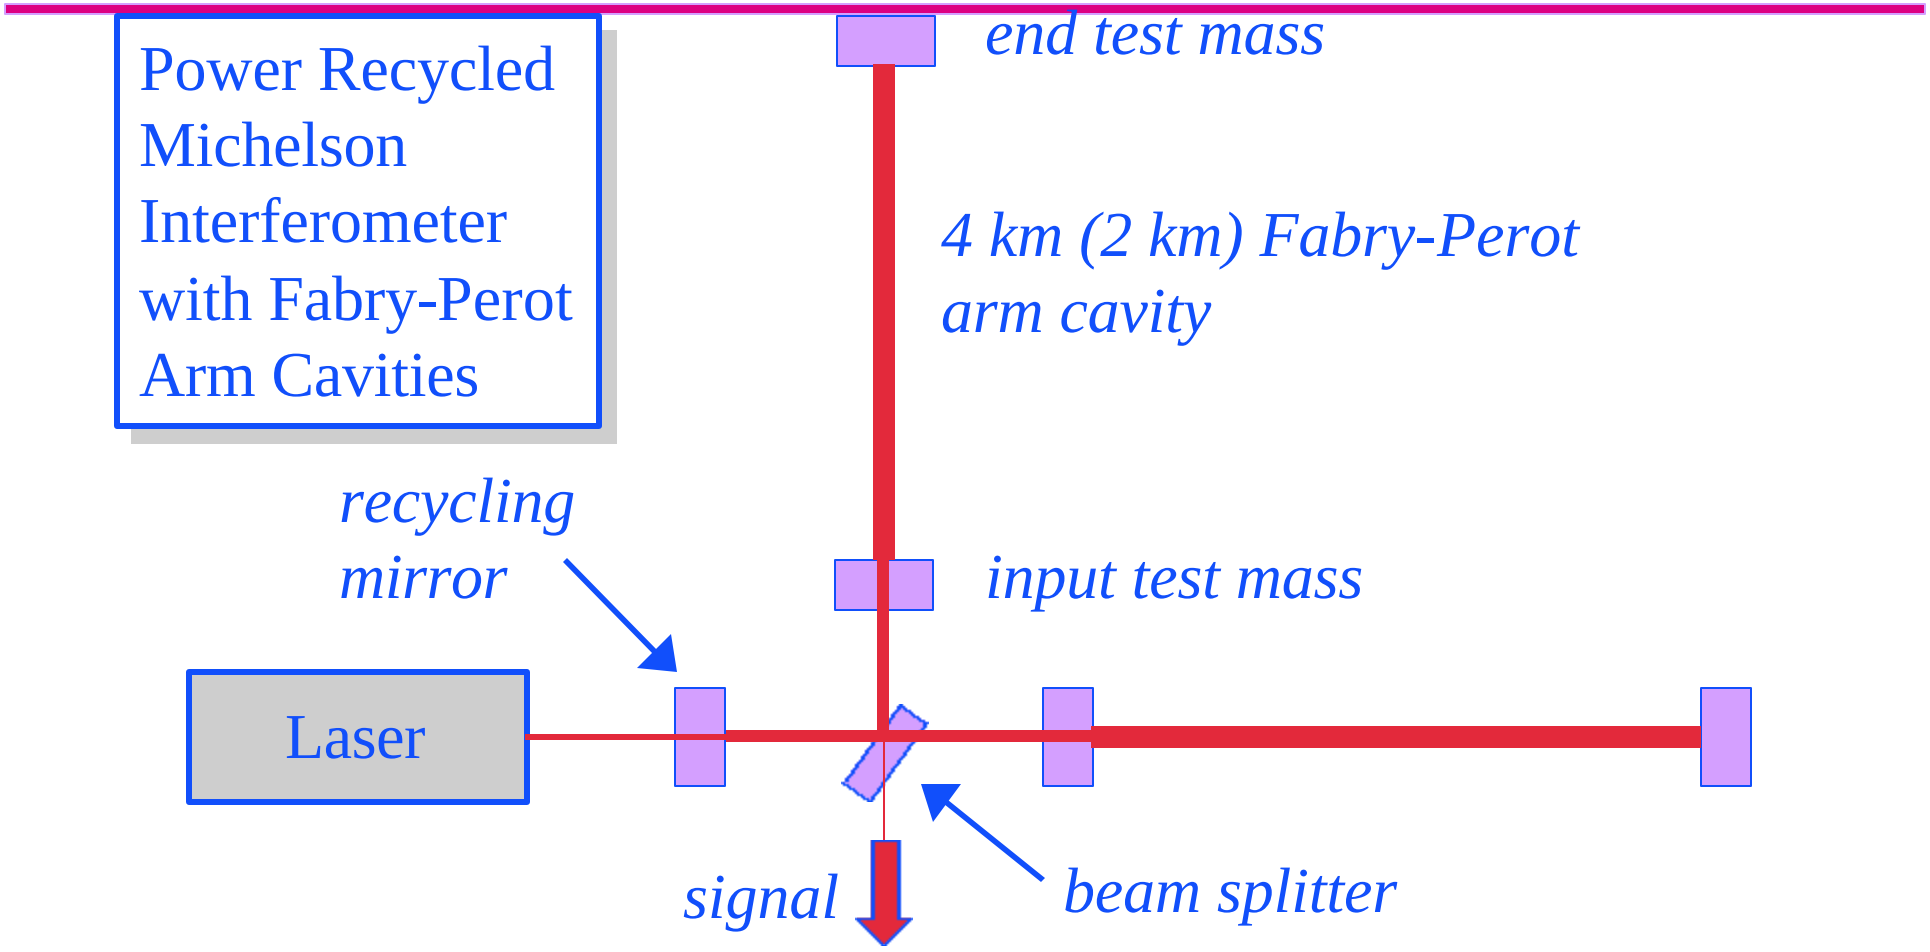
terrestrial

Suspended mass Michelson-type interferometers on earth's surface detect distant astrophysical sources



Suspended test masses

LIGO Interferometers

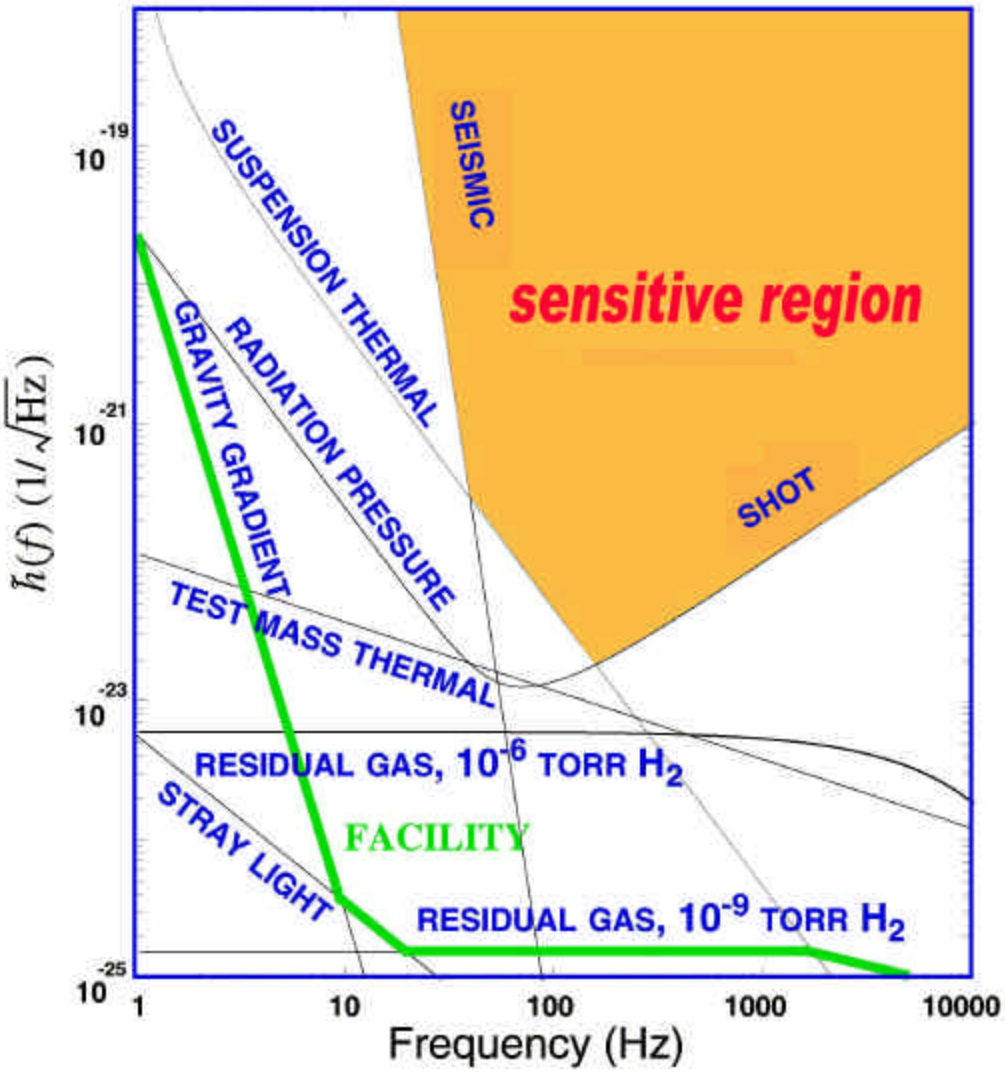


LIGO I

the noise floor

- **Interferometry is limited by three fundamental noise sources**
  - **seismic noise at the lowest frequencies**
  - **thermal noise at intermediate frequencies**
  - **shot noise at high frequencies**

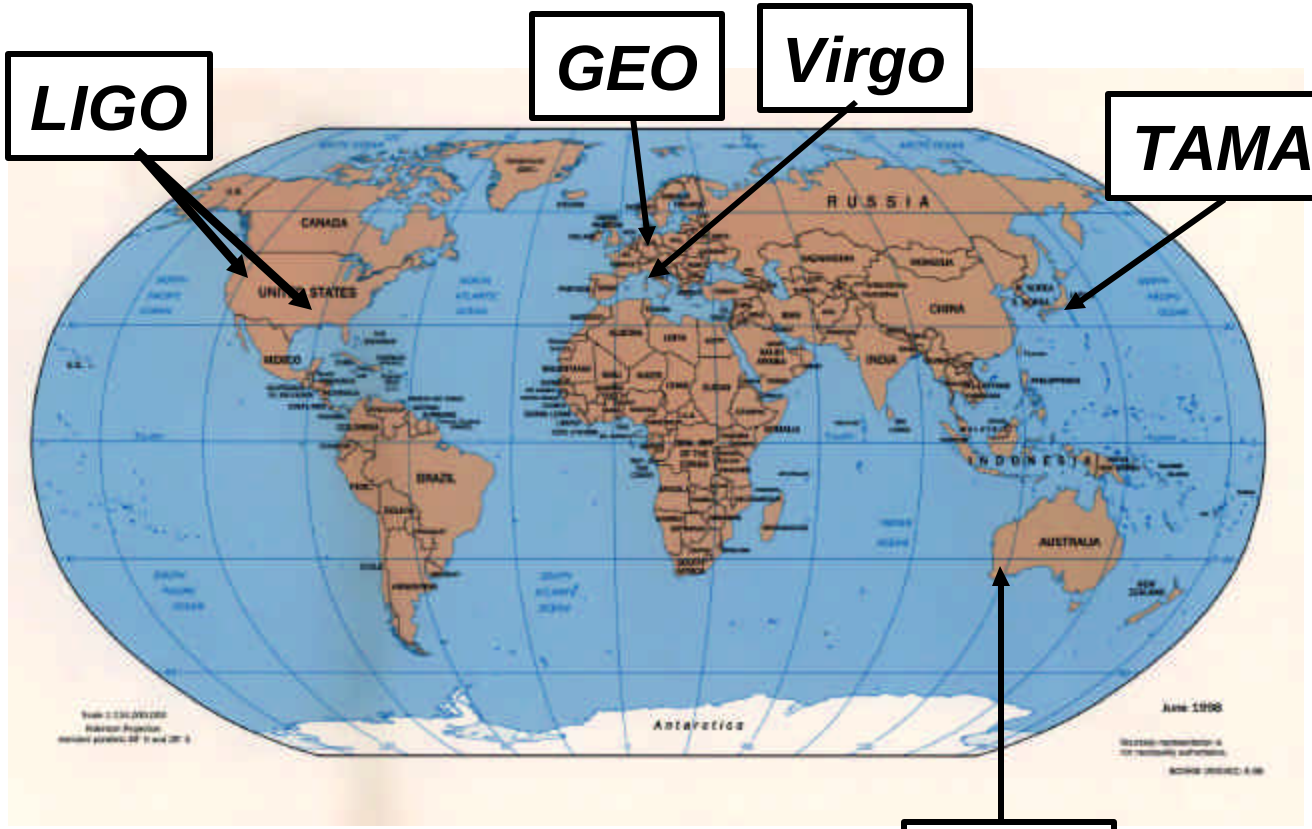
- **Many other noise sources lurk underneath and must be controlled as the instrument is improved**



Interferomers

international network

Simultaneously detect signal (within msec)



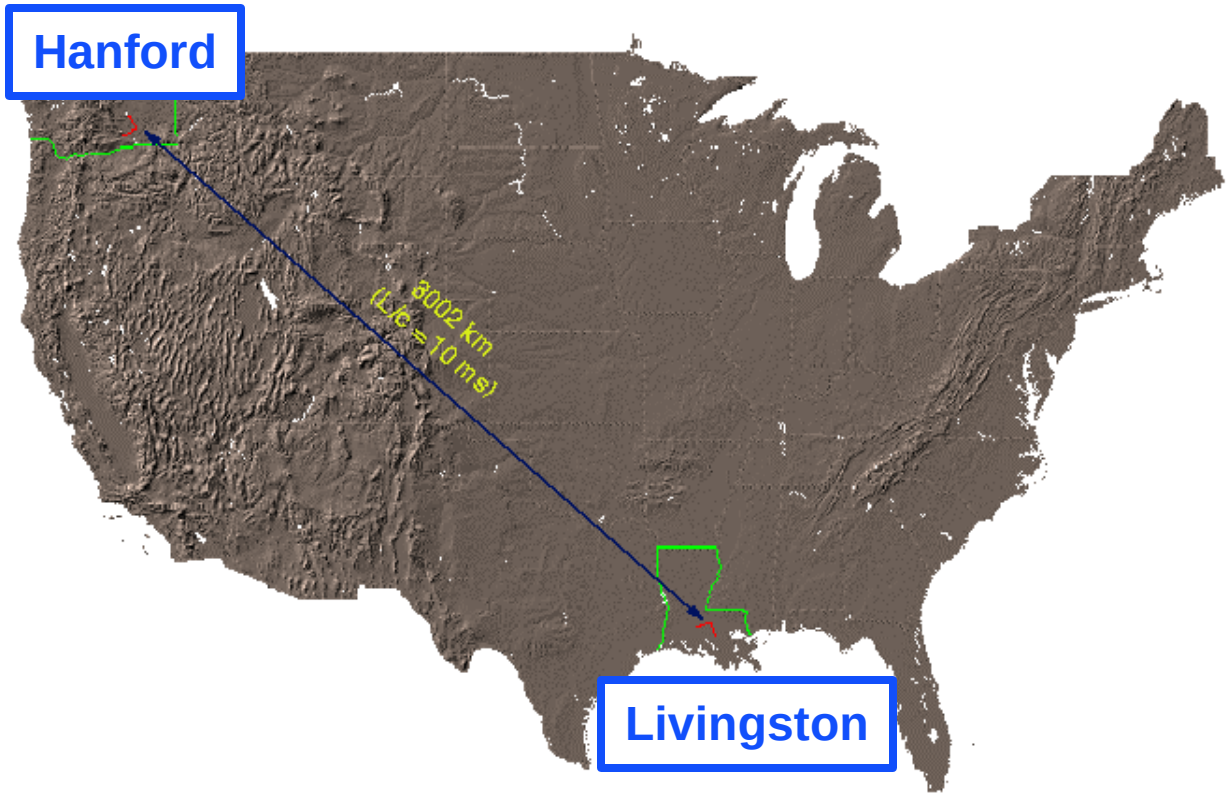
detection confidence

locate the sources

decompose the polarization of gravitational waves

Two Sites - Three Interferometers

- »Single Interferometer non-gaussian level ~50/hr
- »Hanford (Doubles) correlated rate (x1000) ~1/day
- »Hanford + Livingston uncorrelated (x5000) <0.1/yr



Coincidences between LLO & LHO

Interferometers

international network

LIGO (Washington)

LIGO (Louisiana)

Interferometers
international network

GEO 600 (Germany)

Virgo (Italy)

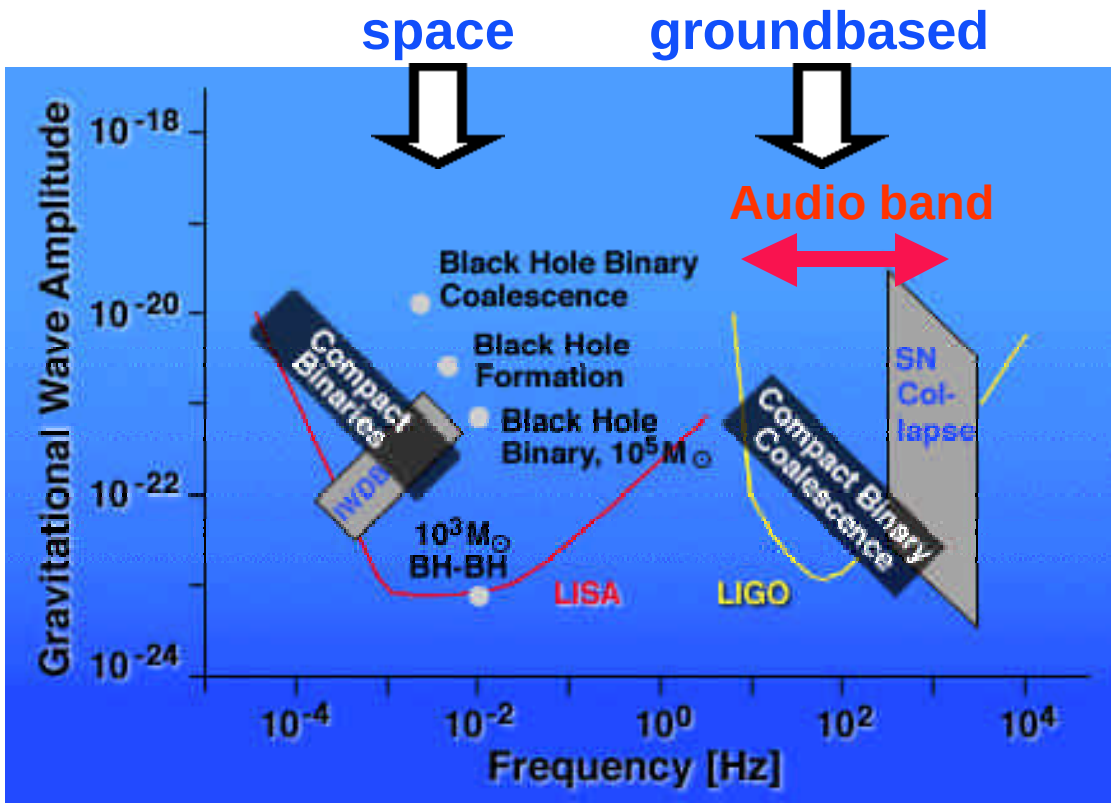
Interferometers
international network

TAMA 300 (Japan)

AIGO (Australia)

Astrophysics Sources
frequency range

- EM waves are studied over ~20 orders of magnitude
  - » (ULF radio –> HE γ rays)
- Gravitational Waves over ~8 orders of magnitude
  - » (terrestrial + space)

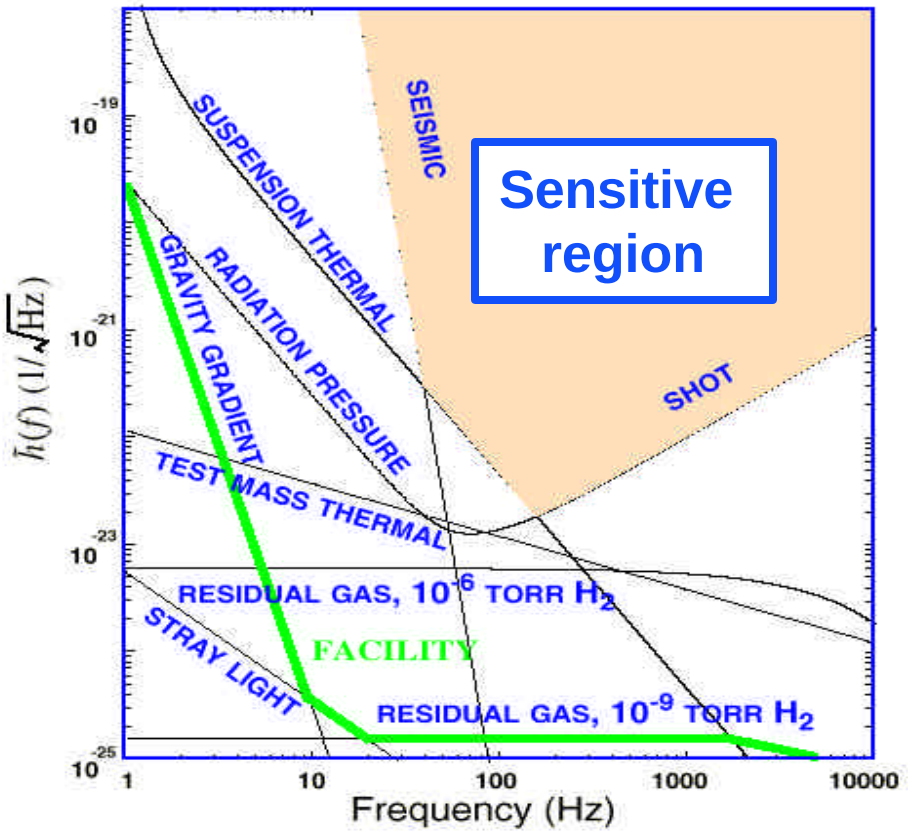


Interferometers

the noise floor

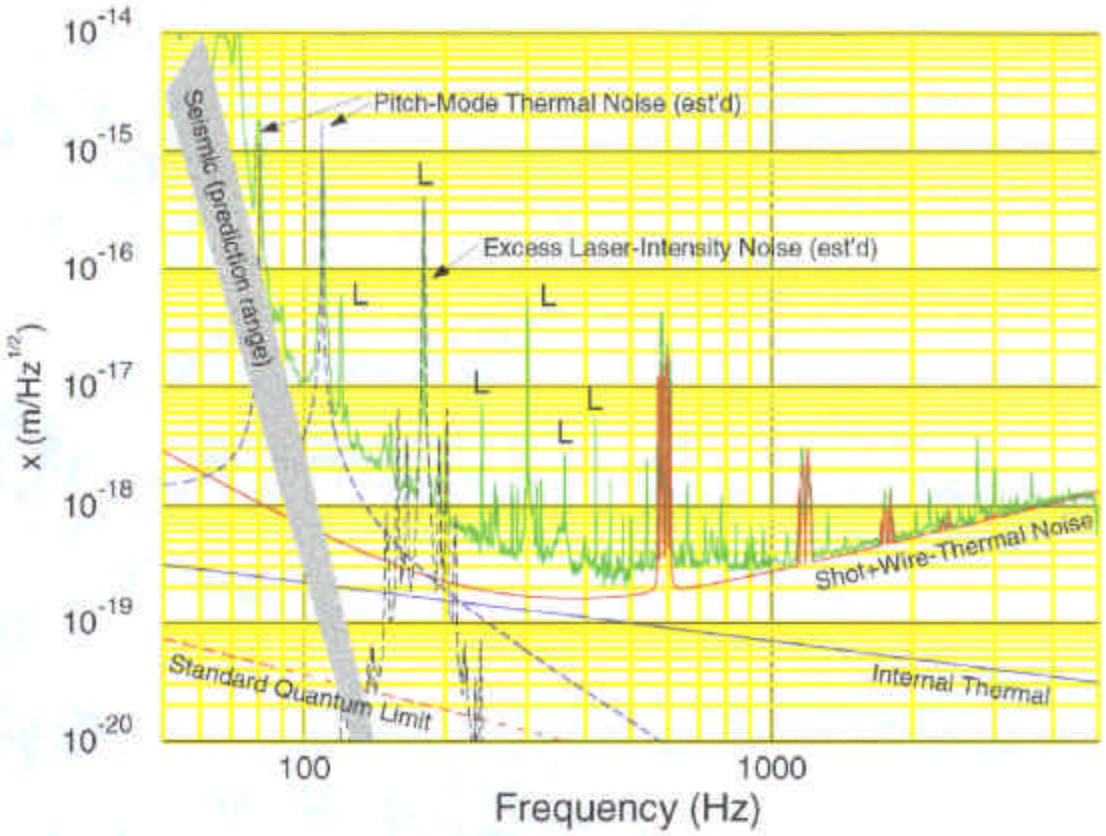
- **Interferometry is limited by three fundamental noise sources**
  - **seismic noise at the lowest frequencies**
  - **thermal noise at intermediate frequencies**
  - **shot noise at high frequencies**

- **Many other noise sources lurk underneath and must be controlled as the instrument is improved**



Noise Floor

40 m prototype



- **displacement sensitivity in 40 m prototype.**
- **comparison to predicted contributions from various noise sources**

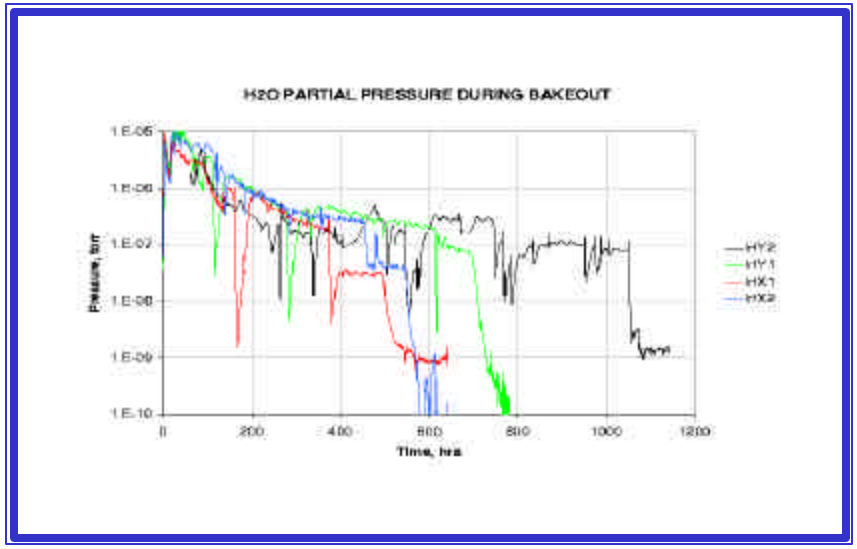
partial pressures during bakeout



Beam Tube Bakeout Results [a]

NOTE: All results except for H_2 are upper limits

		Hanford				Livingston	
Species	Goal [b]	HY2	HY1	HX1	HX2	LX2	
H_2	*4.7*	4.8	6.3	5.2	4.6	4.3	x 10^{-14} torr liters/sec/cm^2
CH_4	*48000*	< 900	< 220	< 8.8	< 95	< 40	x 10^{-20} torr liters/sec/cm^2
H_2O	*1500*	< 4	< 20	< 1.8	< 0.8	< 10	x 10^{-18} torr liters/sec/cm^2
CO	*650*	< 14	< 9	< 5.7	< 2	< 5	x 10^{-18} torr liters/sec/cm^2
CO_2	*2200*	< 40	< 18	< 2.9	< 8.5	< 8	x 10^{-19} torr liters/sec/cm^2
$NO+C_2H_6$	*7000*	< 2	< 14	< 6.6	< 1.0	< 1.1	x 10^{-19} torr liters/sec/cm^2
$H_nC_pO_q$	*50-2* [c]	< 15	< 8.5	< 5.3	< 0.4	< 4.3	x 10^{-19} torr liters/sec/cm^2
air leak	*1000*	< 20	< 10	< 3.5	< 16	< 7	x 10^{-11} torr liter/sec

[a] *Outgassing results correct to 23 C*

[b] *Goal: maximum outgassing to achieve pressure equivalent to 10^{-9} torr H_2 using only pumps at stations*

[c] *Goal for hydrocarbons depends on weight of parent molecule; range given corresponds with 100-300 AMU*

Achieved Design Requirements
(< 10^{-9} torr)

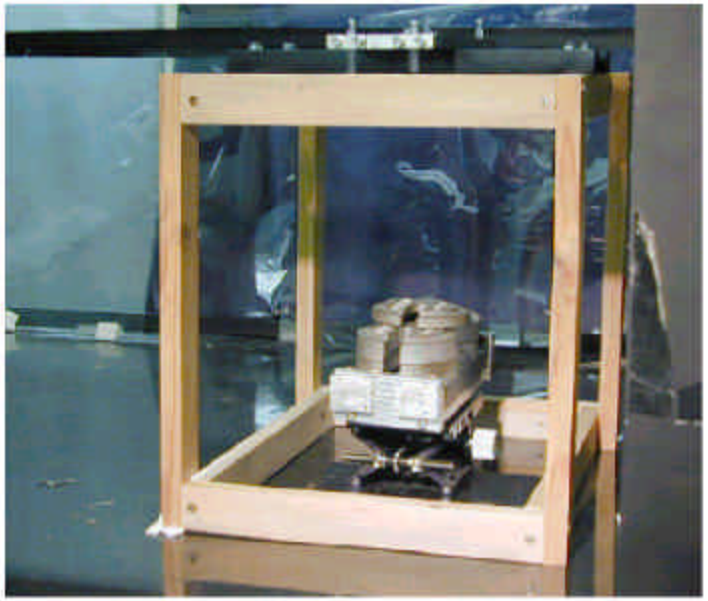
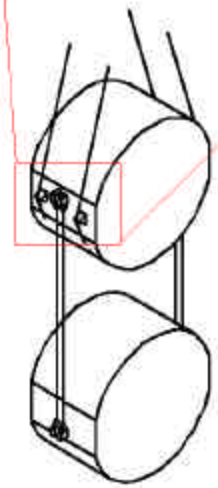
Test Masses

fibers and bonding - GEO

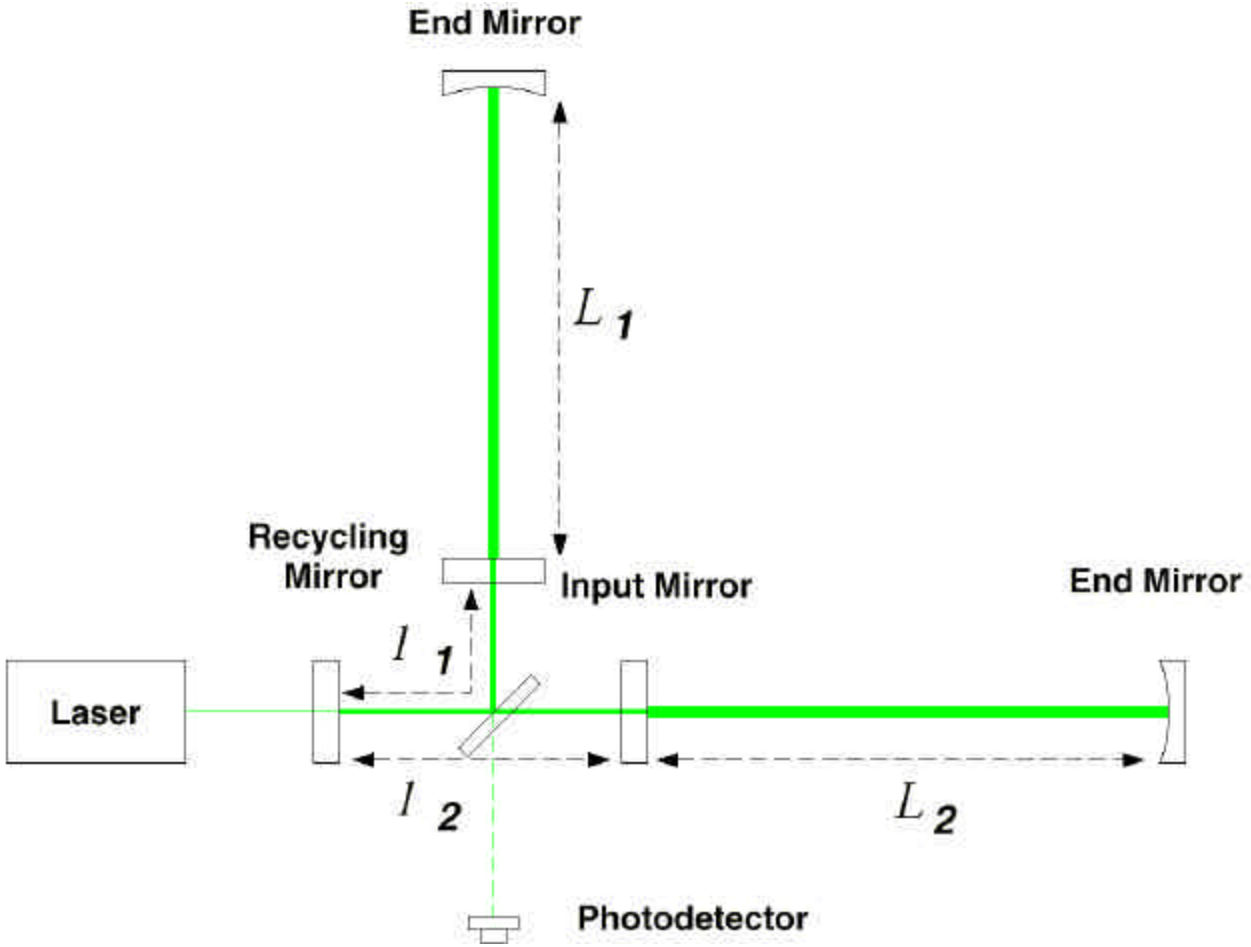




Since 2-11-99
10 kg are suspended
with 4 x 180 mm
welded fibres
in air

Interferometers

basic optical configuration



Core Optics
fused silica

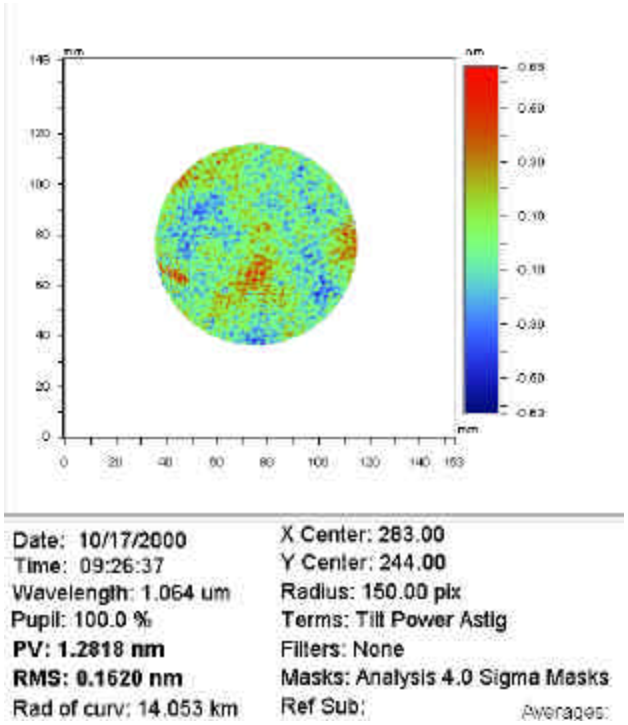
LIGO requirements

- **Surface uniformity < 1 nm rms**
- **Scatter < 50 ppm**
- **Absorption < 2 ppm**
- **ROC matched < 3%**
- **Internal mode Q's > 2 x 10^6**

LIGO measurements

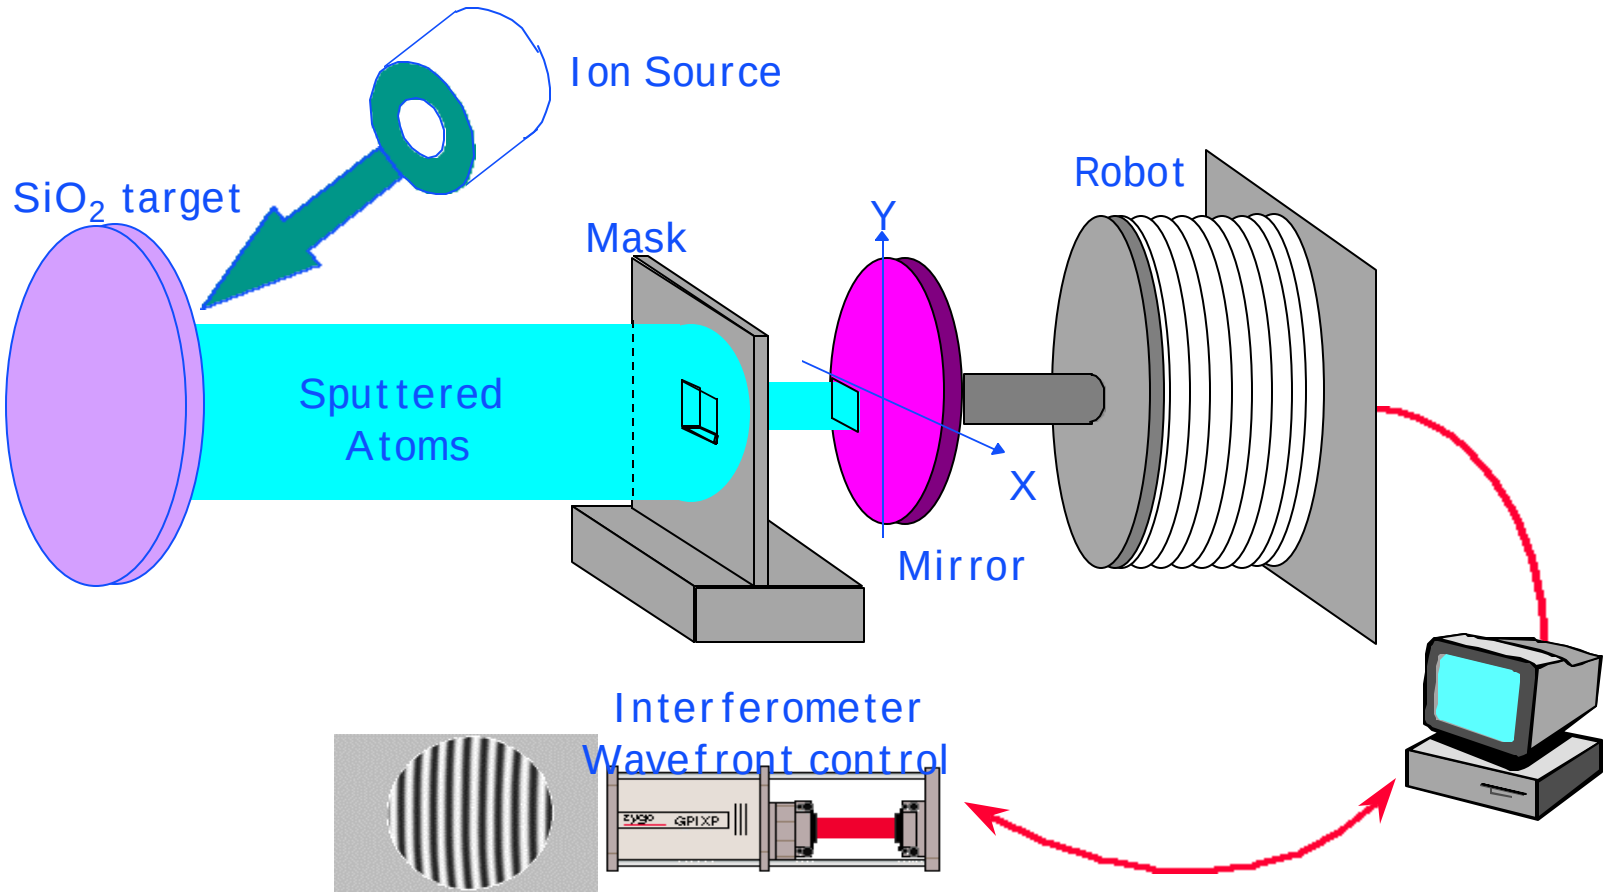
- **central 80 mm of 4ITM06 (Hanford 4K)**
- **rms = 0.16 nm**
- **optic far exceeds specification.**

Surface figure = λ/ 6000



Corrective Coating

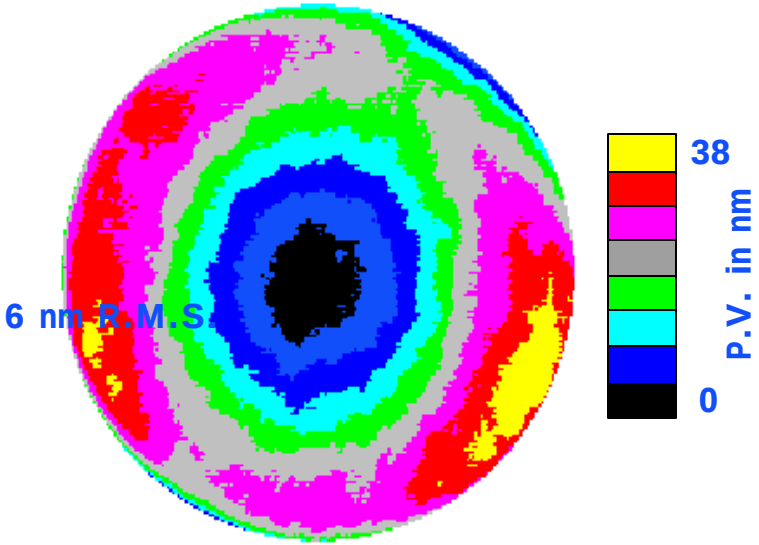
Virgo



Corrective Coating
results

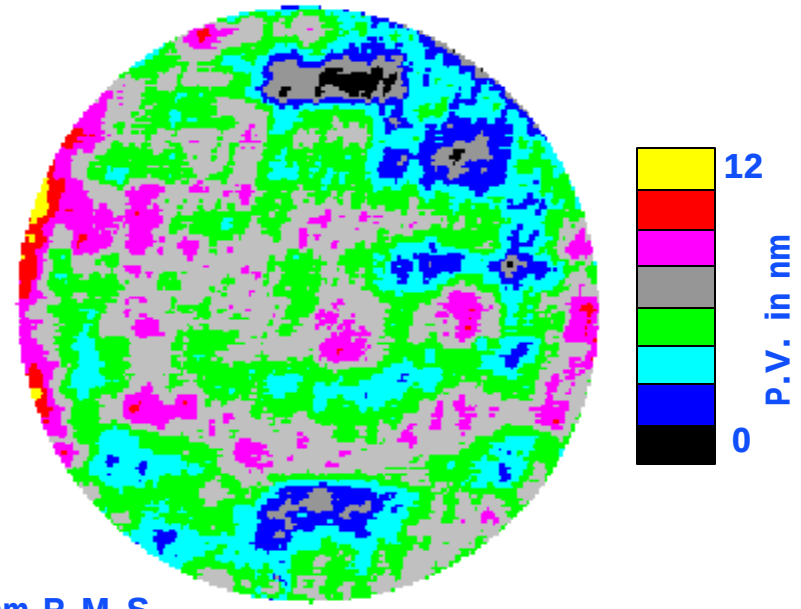
80 mm high reflectivity mirror @633 nm

Before



6 nm R.M.S

After



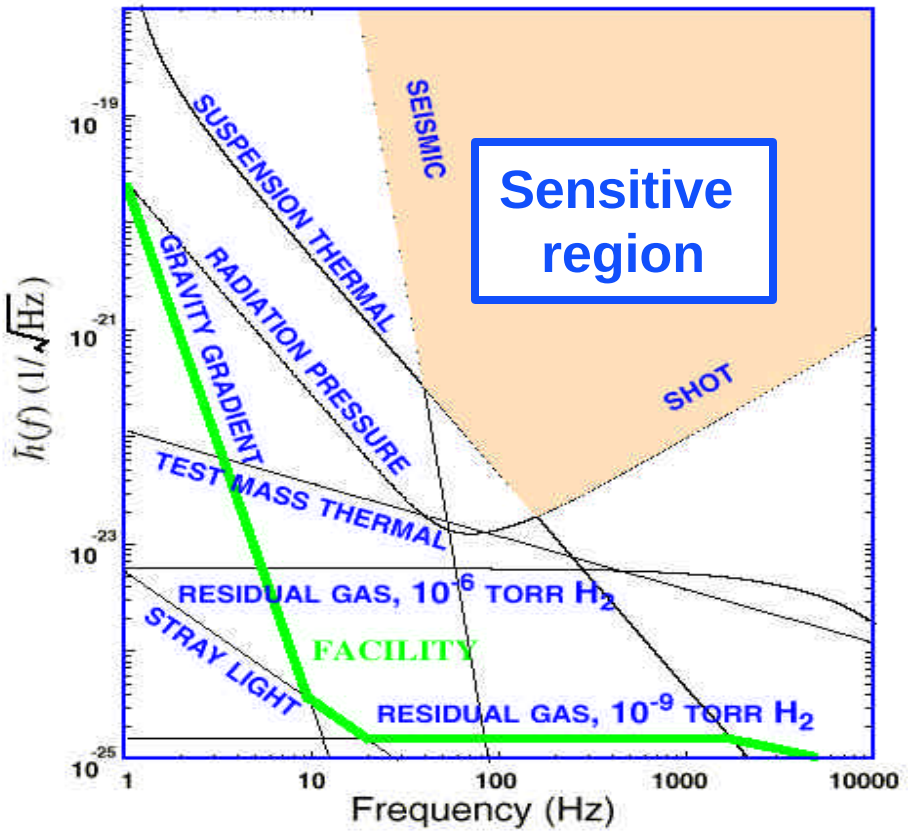
1,5 nm R.M.S.

Interferometers

the noise floor

- **Interferometry is limited by three fundamental noise sources**
  - **seismic noise at the lowest frequencies**
  - **thermal noise at intermediate frequencies**
  - **shot noise at high frequencies**

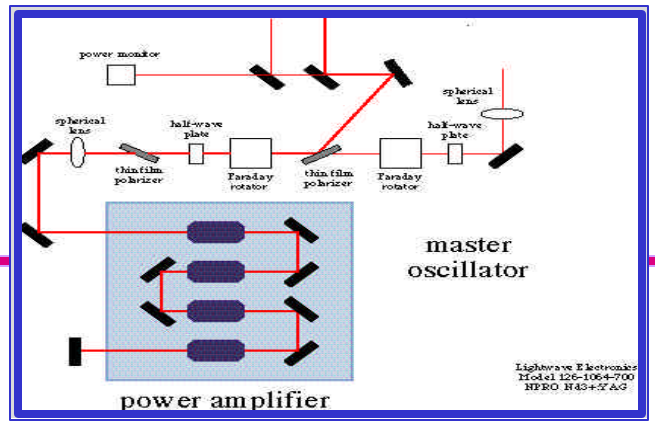
- **Many other noise sources lurk underneath and must be controlled as the instrument is improved**



Interferometers

Lasers

- Nd:YAG (1.064 µm)
- Output power > 8W in TEM00 mode



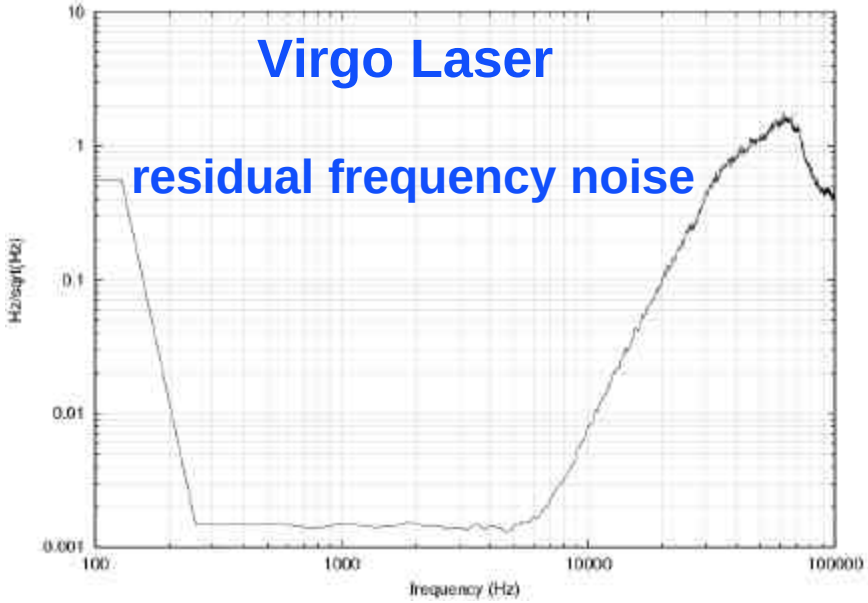
LIGO Laser
master oscillator power amplifier

GEO Laser

Master-Slave configuration with 12W output power

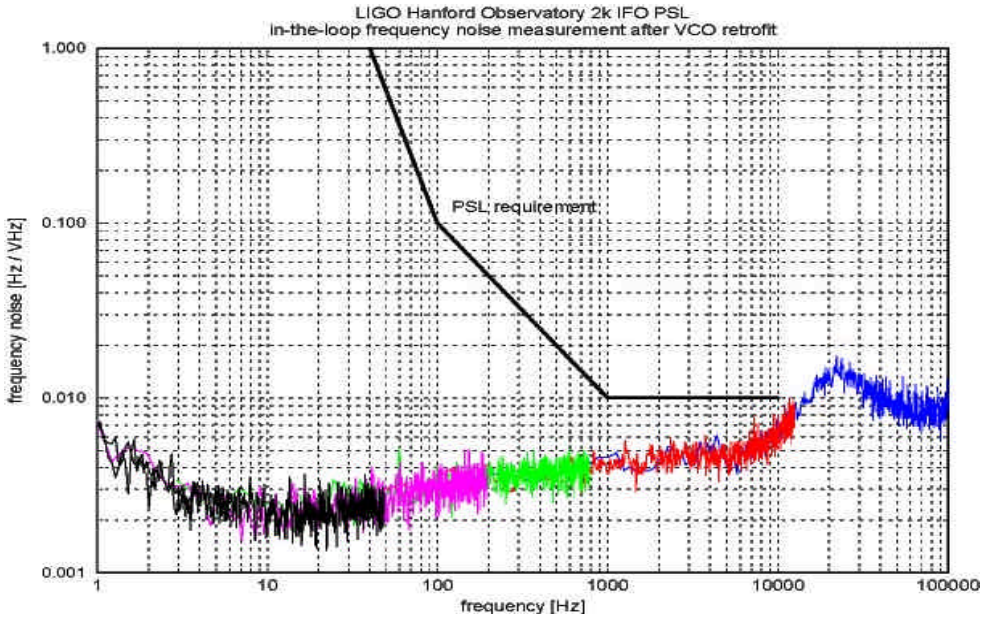
Virgo Laser

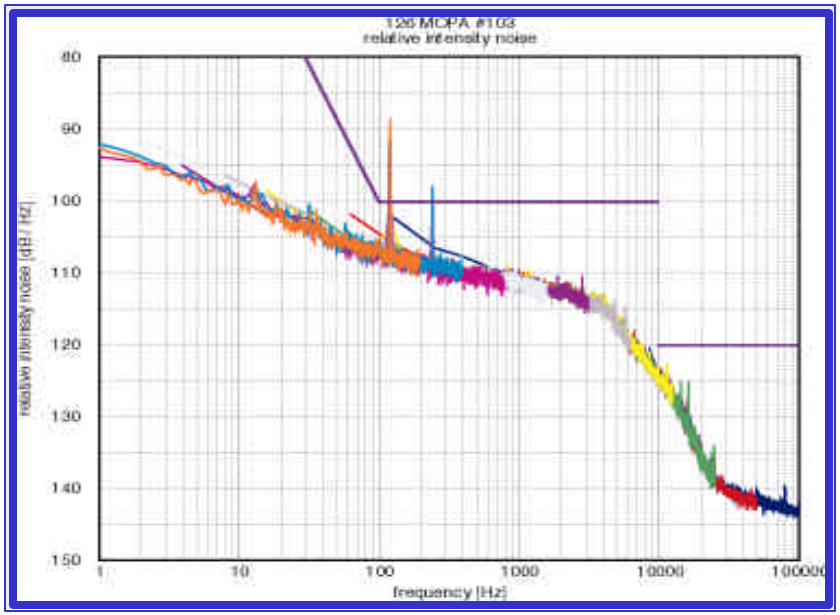
residual frequency noise



Laser

pre-stabilization



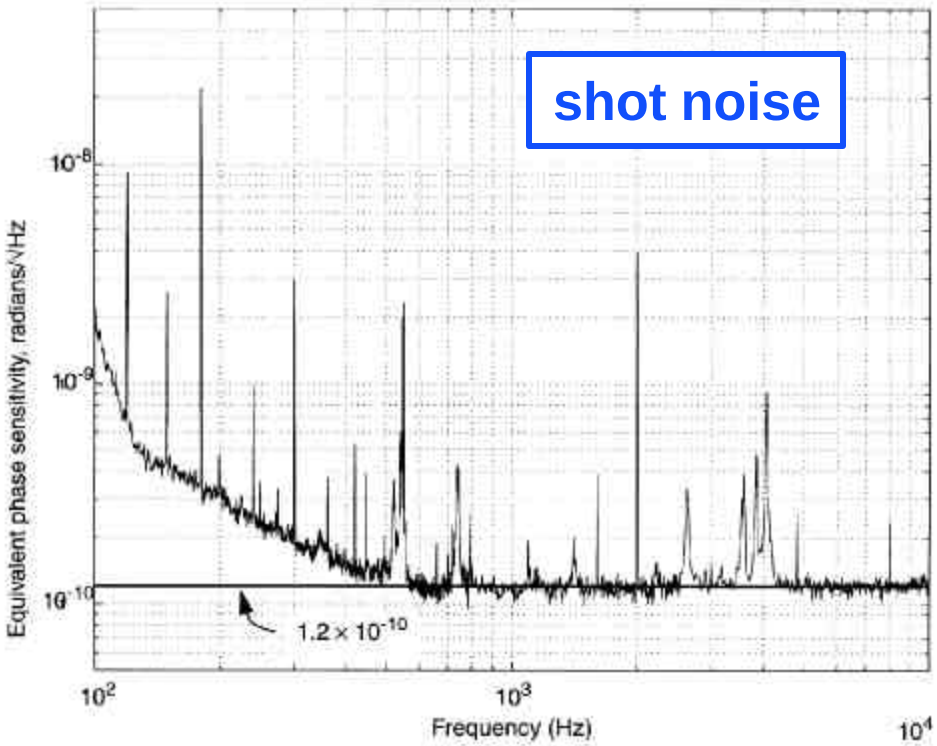


- **frequency noise:**
- **$dn(f) < 10^{-2} Hz/Hz^{1/2}$ 40Hz<f<10KHz**

- **intensity noise:**
- **$dI(f)/I < 10^{-6}/Hz^{1/2}$, 40 Hz<f<10 KHz**

Phase Noise

splitting the fringe

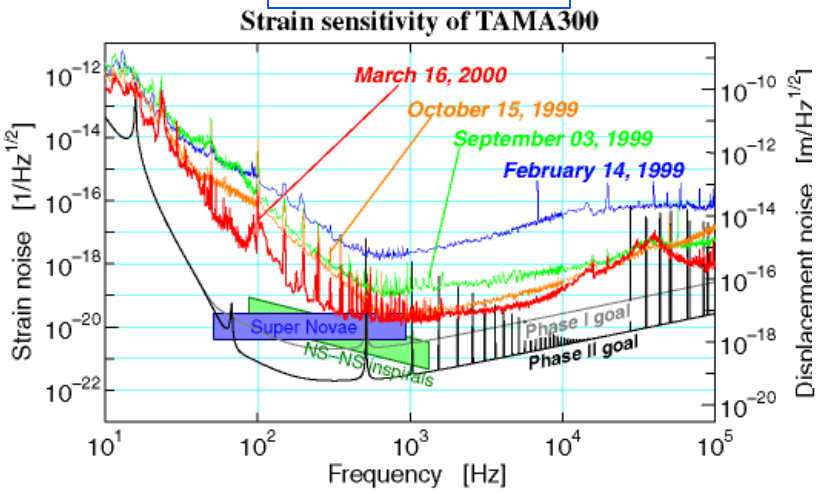


- spectral sensitivity of MIT phase noise interferometer
- above 500 Hz shot noise limited near LIGO I goal
- additional features are from 60 Hz powerline harmonics, wire resonances (600 Hz), mount resonances, etc

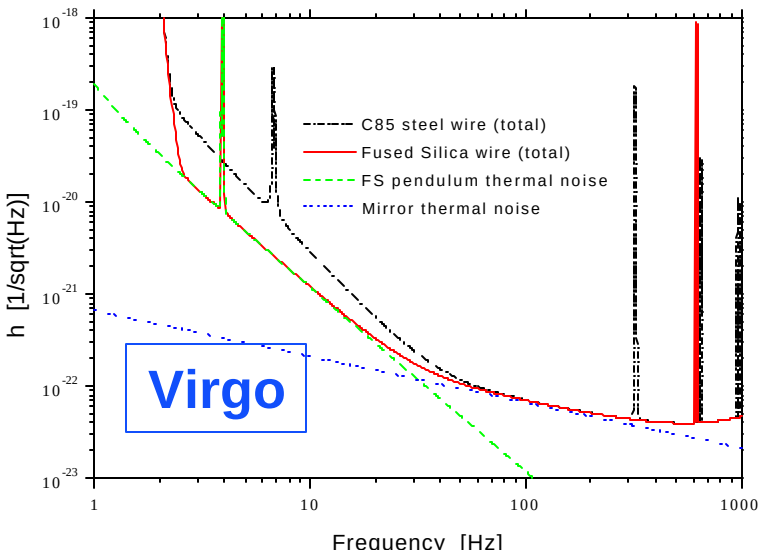
Interferometers

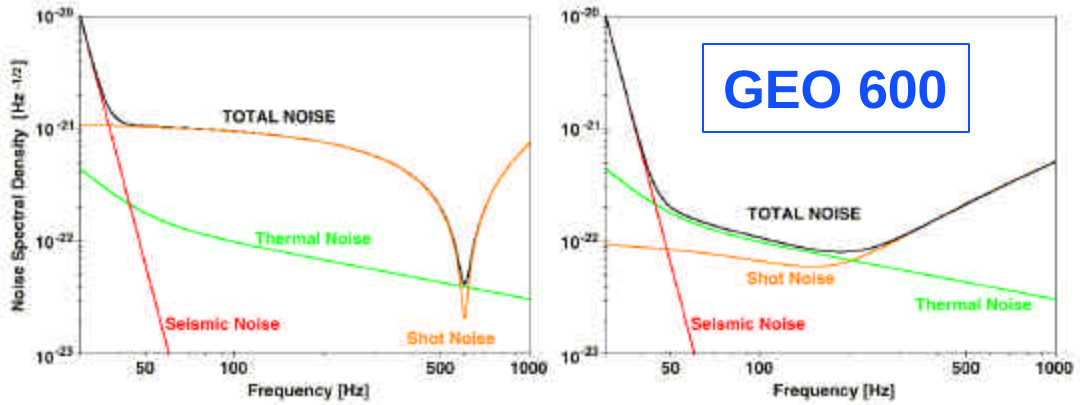
sensitivity curves

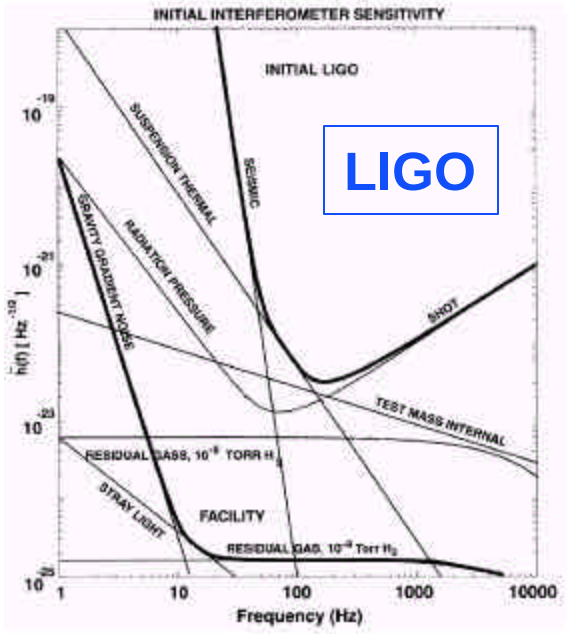
TAMA 300



Virgo sensitivity curve







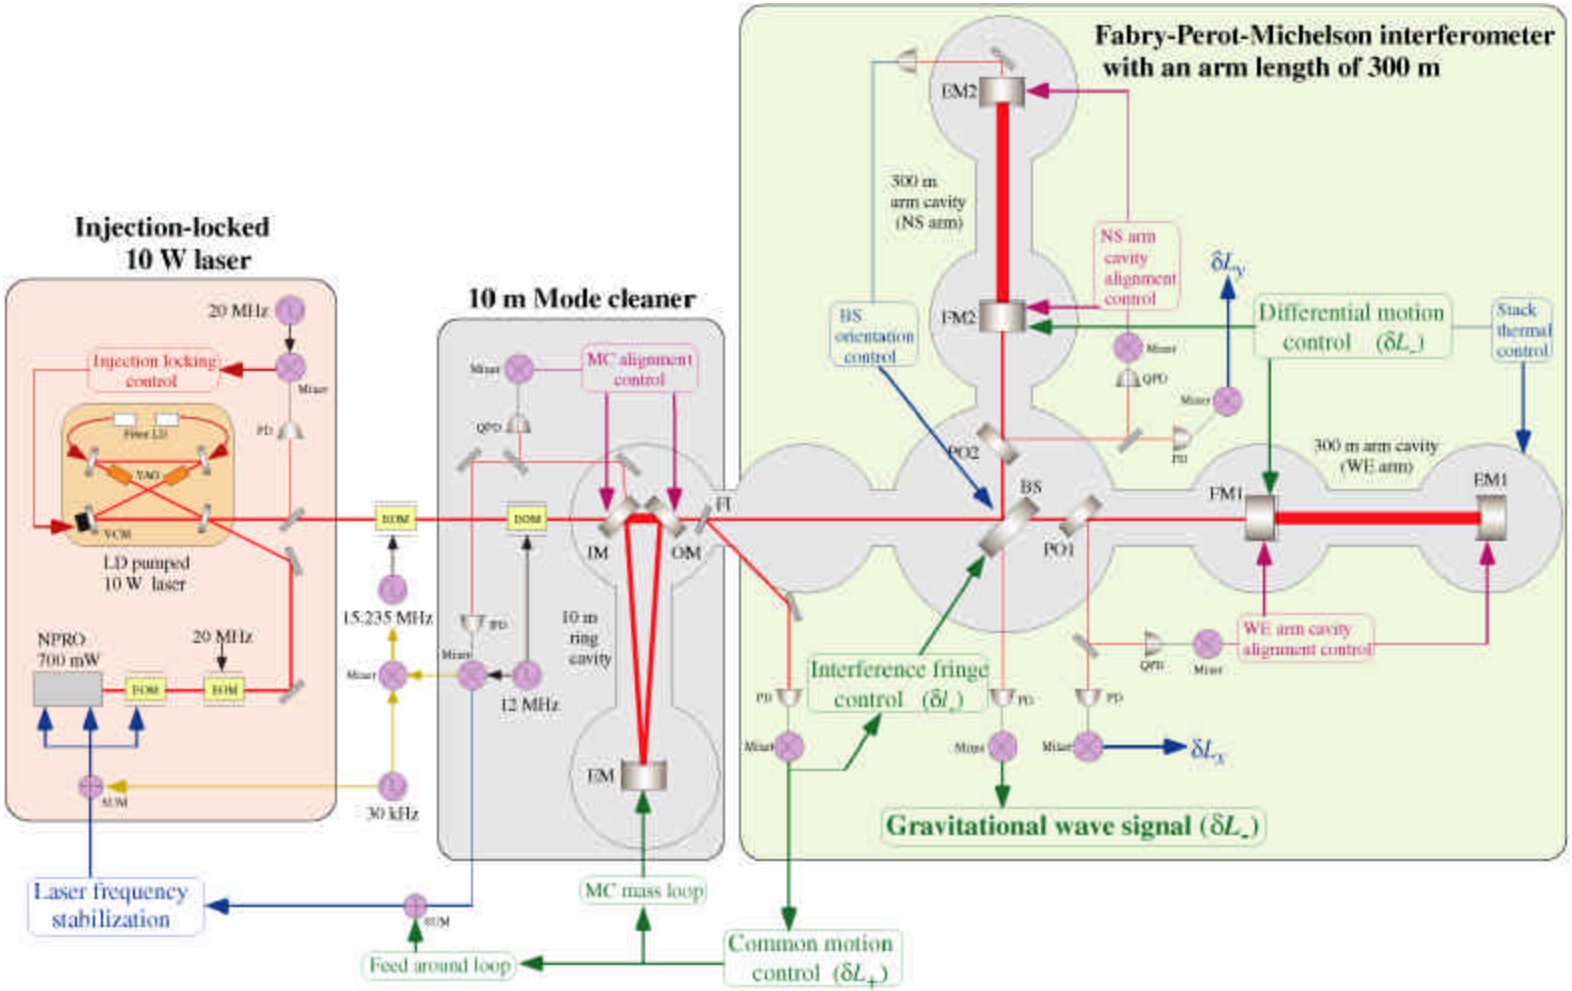
Interferometers

testing and commissioning

- **TAMA 300**
  - » **interferometer locked; noise studies**
- **LIGO**
  - » **input optics commissioned;**
  - » **2 km single arm locked/tested**
- **Geo 600**
  - » **commissioning tests**
- **Virgo**
  - » **testing isolation systems; input optics**
- **AIGO**
  - » **setting up central facility**

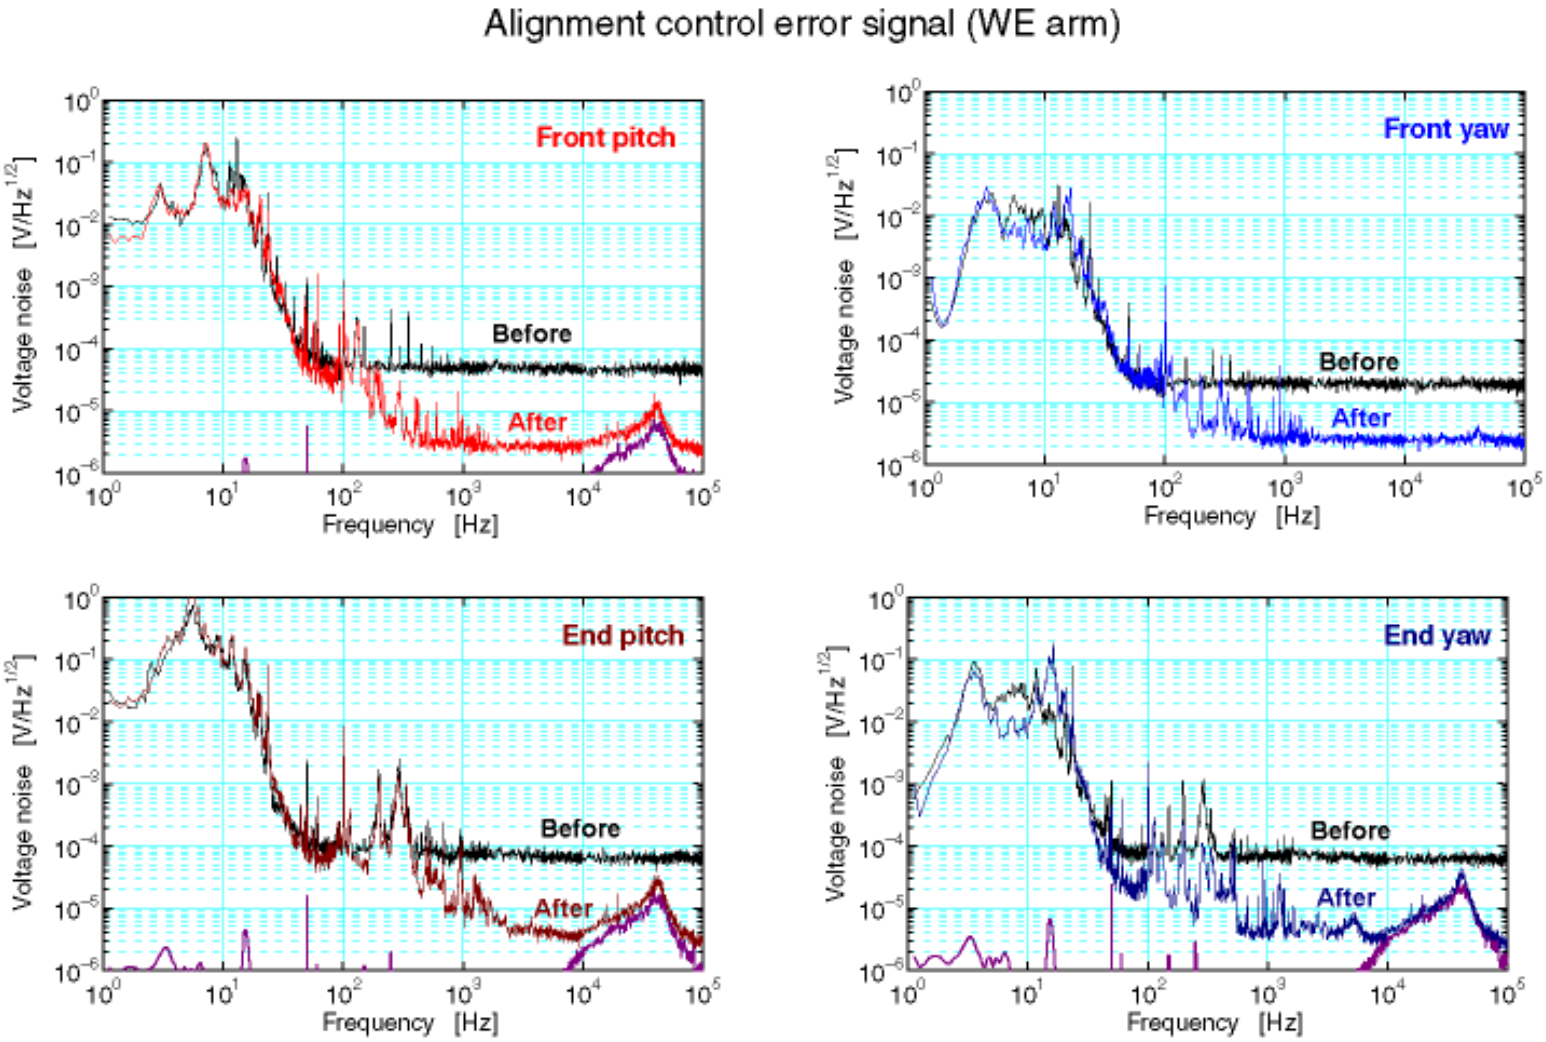
TAMA 300

optical configuration



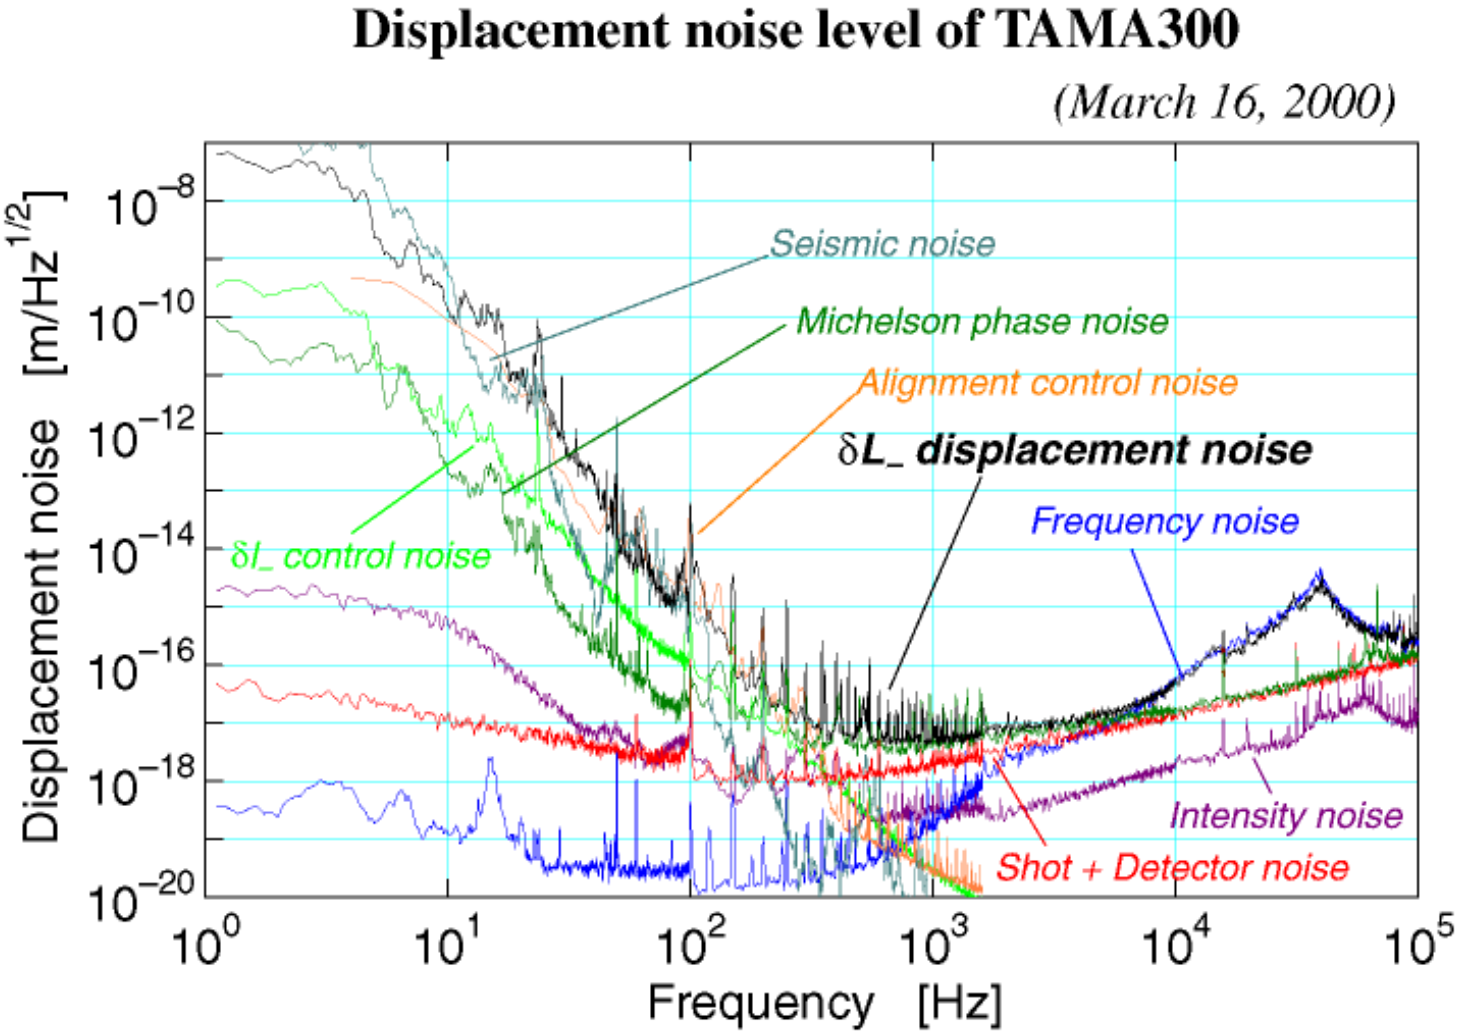
TAMA Commissioning

control error signals



TAMA Performance

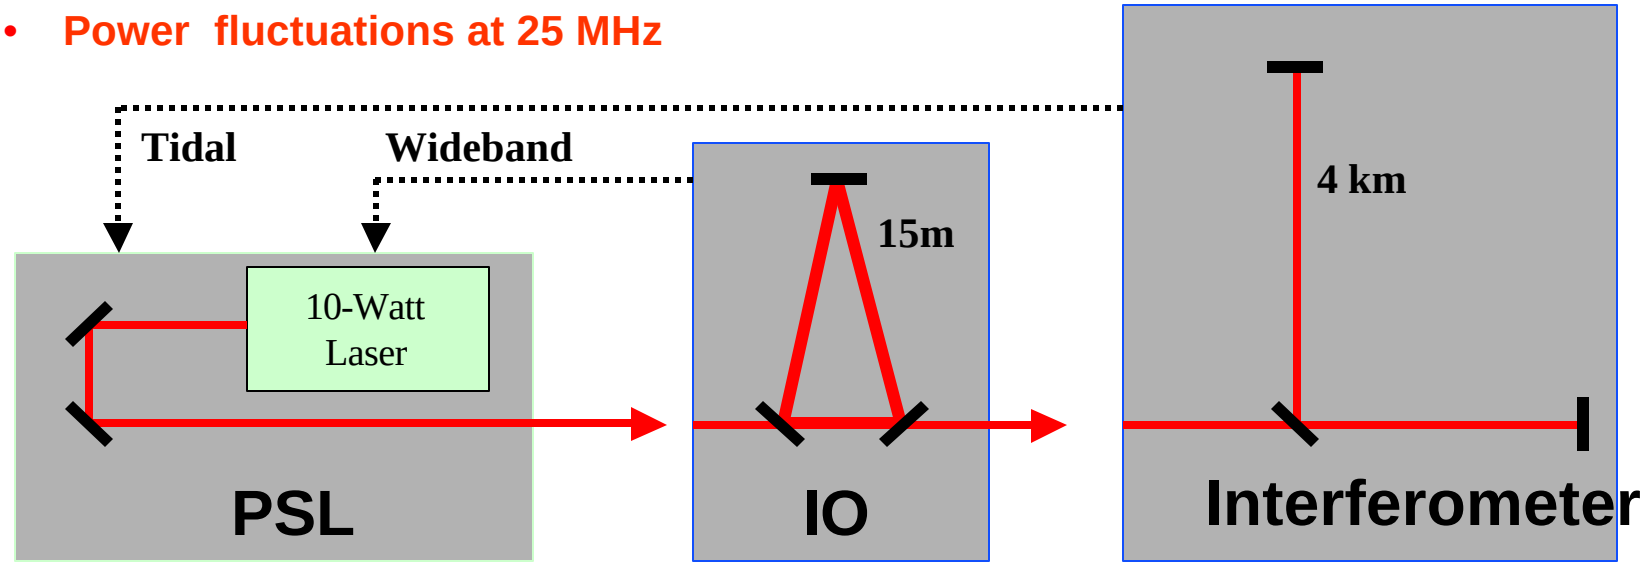
noise source analysis



Laser
stabilization

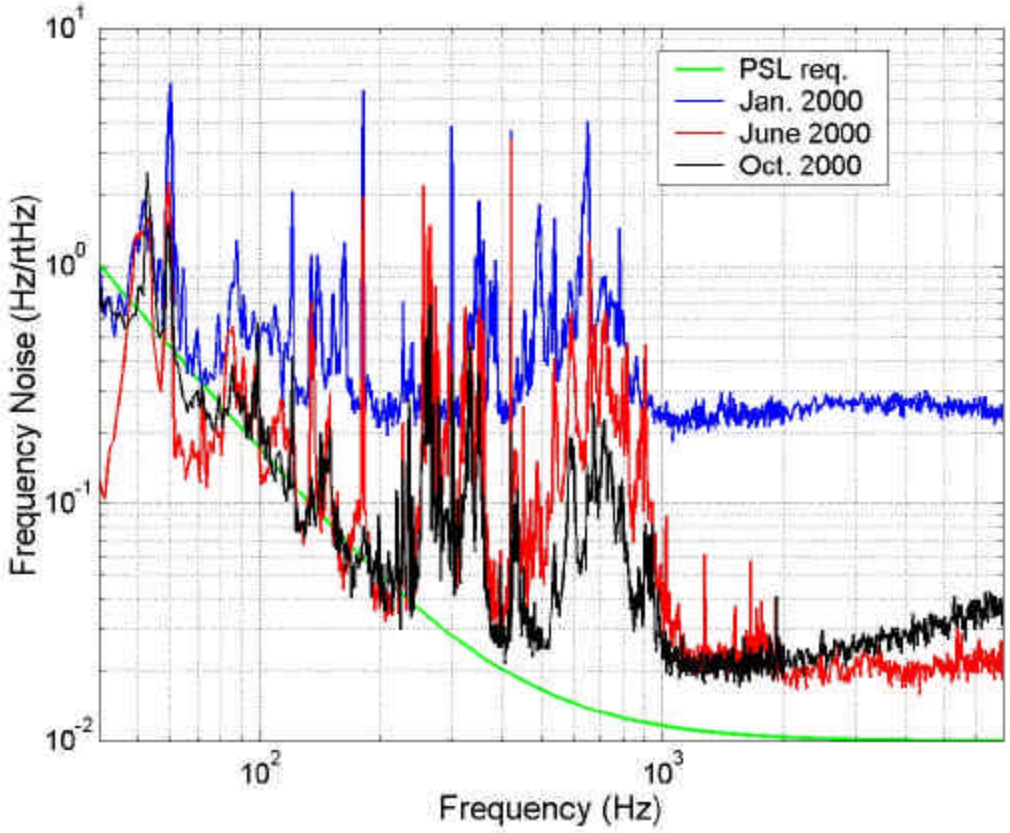
- **Deliver pre-stabilized laser light to the 15-m mode cleaner**
  - **Frequency fluctuations**
  - **In-band power fluctuations**
  - **Power fluctuations at 25 MHz**

- **Provide actuator inputs for further stabilization**
  - **Wideband**
  - **Tidal**



10^{-1} Hz/Hz$^{1/2}$ **10^{-4} Hz/ Hz$^{1/2}$** **10^{-7} Hz/ Hz$^{1/2}$**

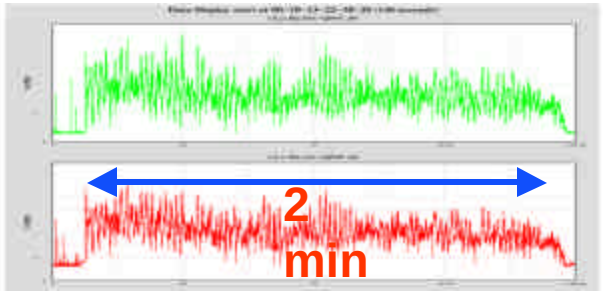
Pre-stabilized Laser
performance



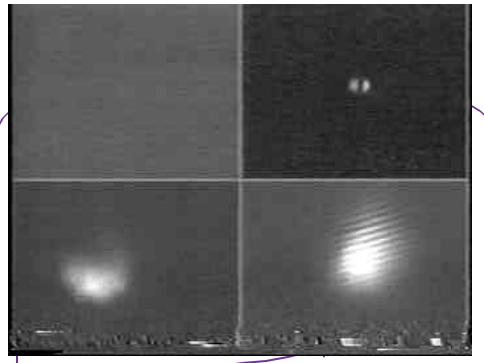
- **> 18,000 hours continuous operation**
- **Frequency and lock very robust**
- **TEM_{00} power > 8 watts**
- **Non-TEM_{00} power < 10%**

LIGO

first lock



Composite Video



Y Arm

Laser

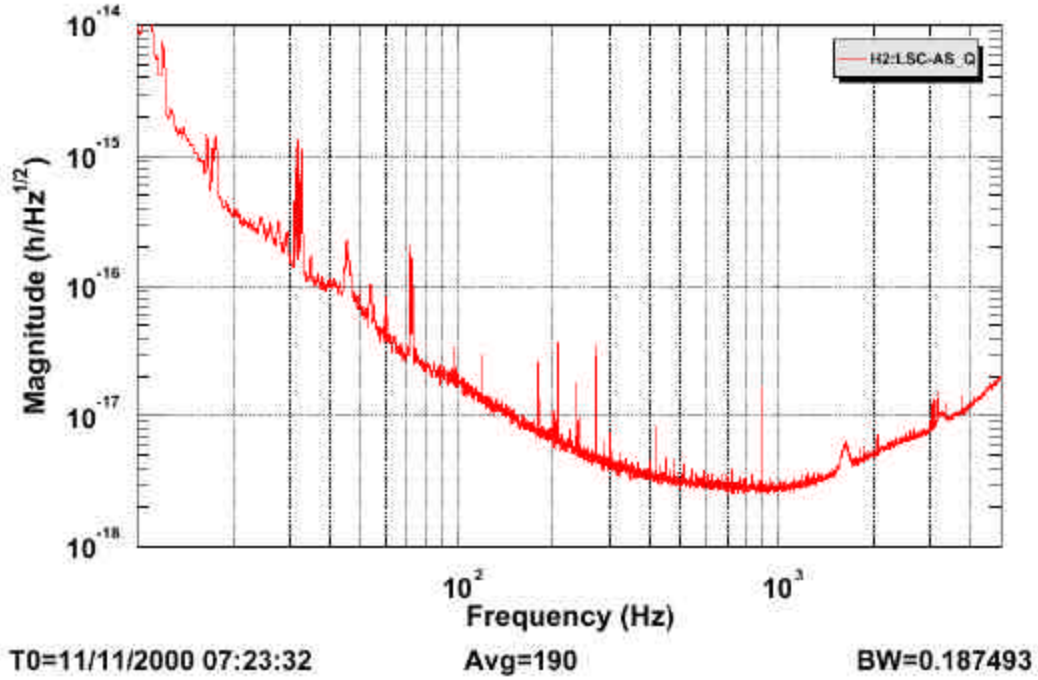
X Arm

signal

Strain Sensitivity

Nov 2000

2-km Hanford Interferometer

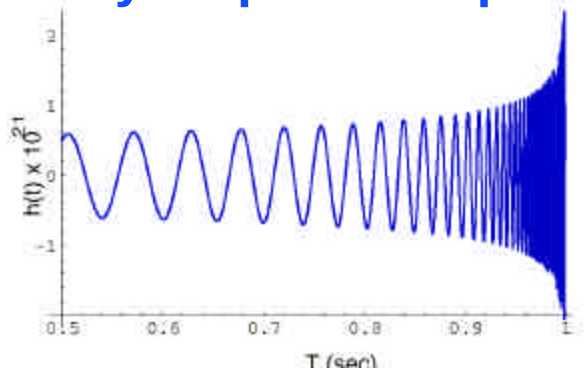


- operating as a Michelson with Fabry-Perot arms
- reduced input laser power on the beam splitter (about 3 mW)
- without recycling
- noise level is a factor of 10^4-10^5 above the final specification
- sources of excess noise are under investigation

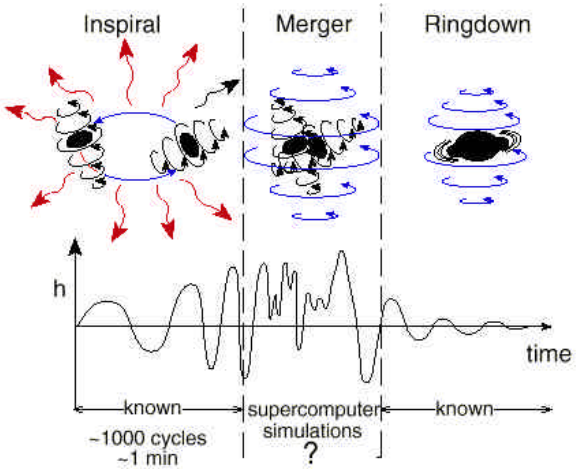
Interferometers

astrophysical sources

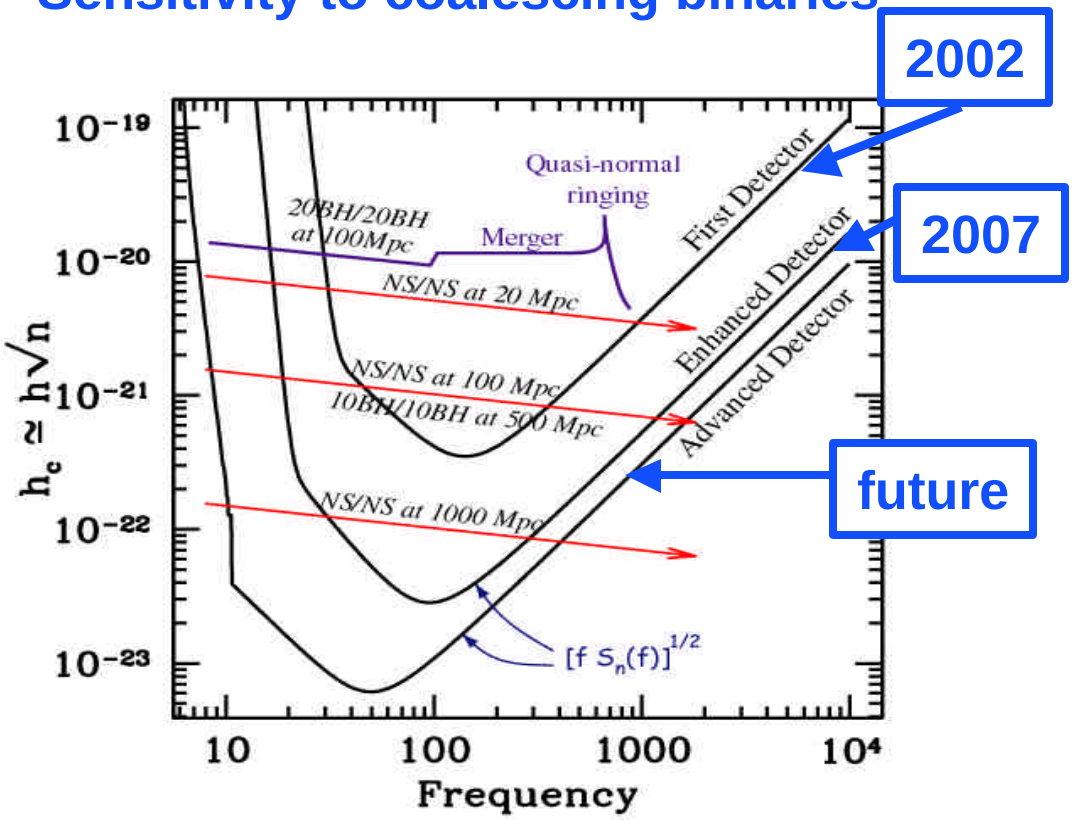
Binary inspiral ‘chirp’ signal



Compact binary mergers



Sensitivity to coalescing binaries



Interferometer
data analysis

- **Compact binary inspiral:** ***"chirps"***
  - » **NS-NS waveforms are well described**
  - » **BH-BH need better waveforms**
  - » **search technique: matched templates**

- **Supernovae / GRBs:** ***"bursts"***
  - » **burst signals in coincidence with signals in electromagnetic radiation**
  - » **prompt alarm (~ one hour) with neutrino detectors**

- **Pulsars in our galaxy:** ***"periodic"***
  - » **search for observed neutron stars (frequency, doppler shift)**
  - » **all sky search (computing challenge)**
  - » **r-modes**

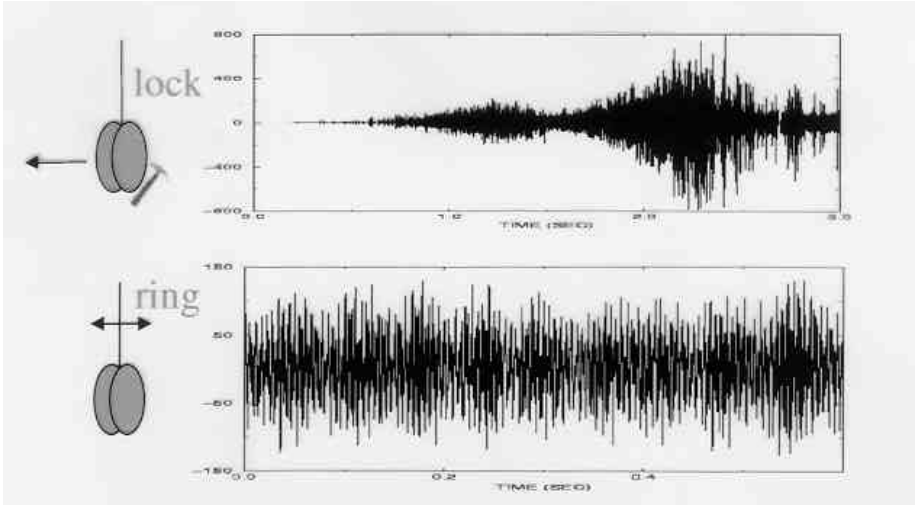
Interferometer Data

40 m

Real interferometer data is UGLY!!!

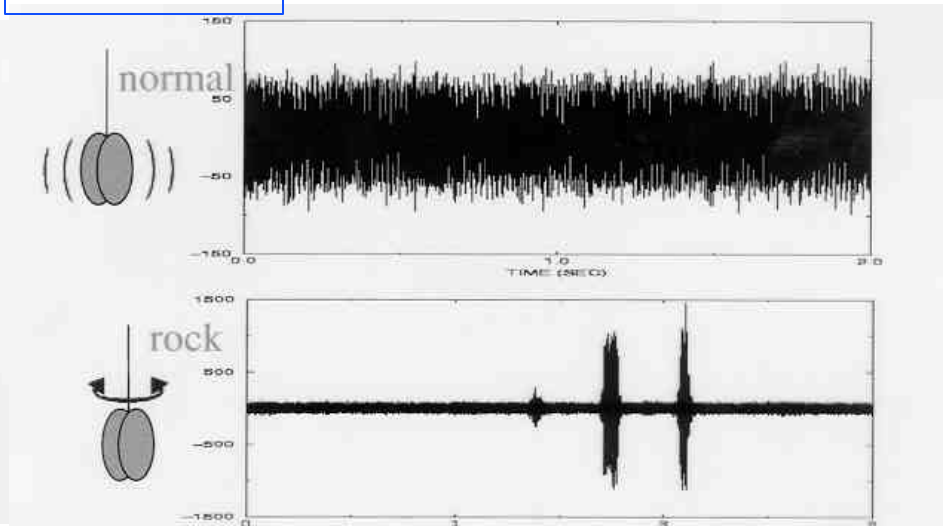
(Gliches - known and unknown)

LOCKING



RINGING

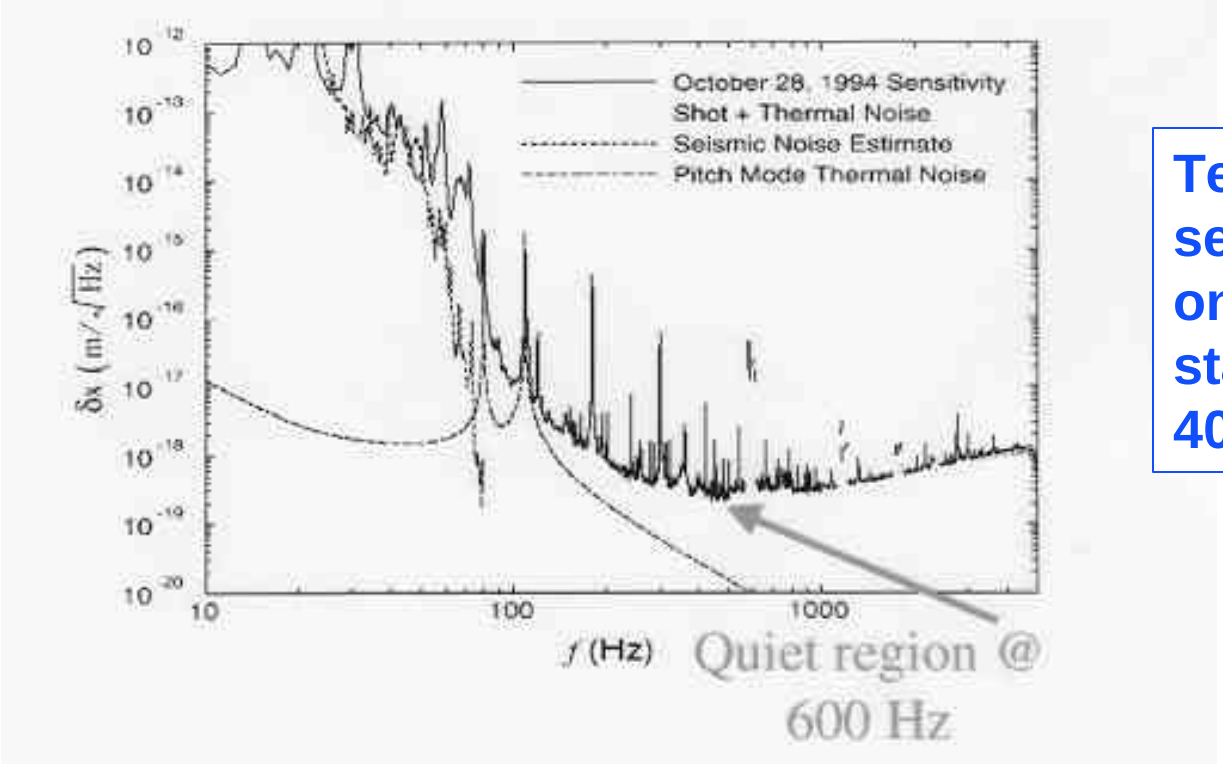
NORMAL



ROCKING

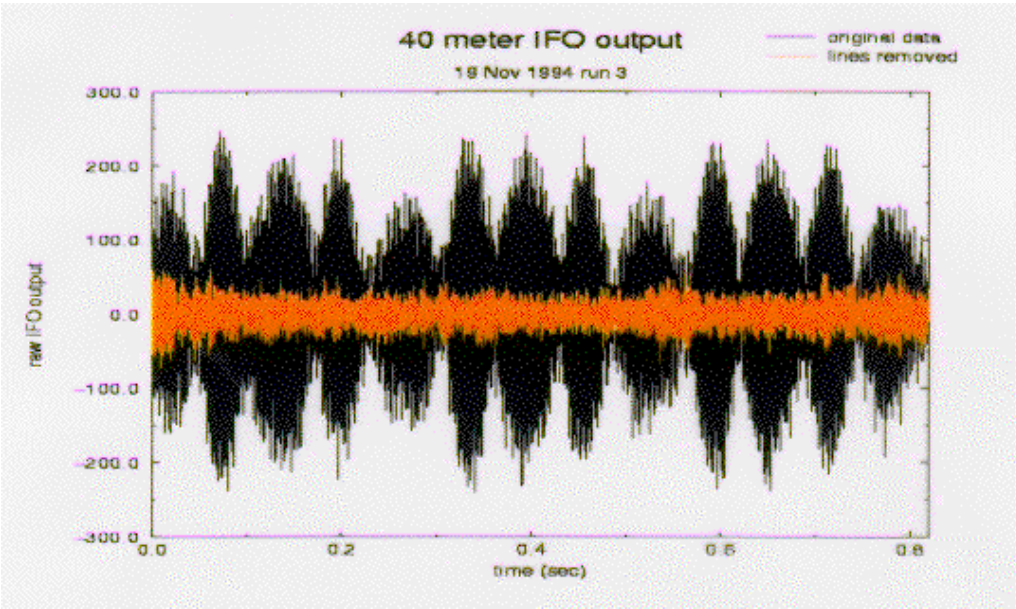
The Problem

How much does real data degrade complicate the data analysis and degrade the sensitivity ??

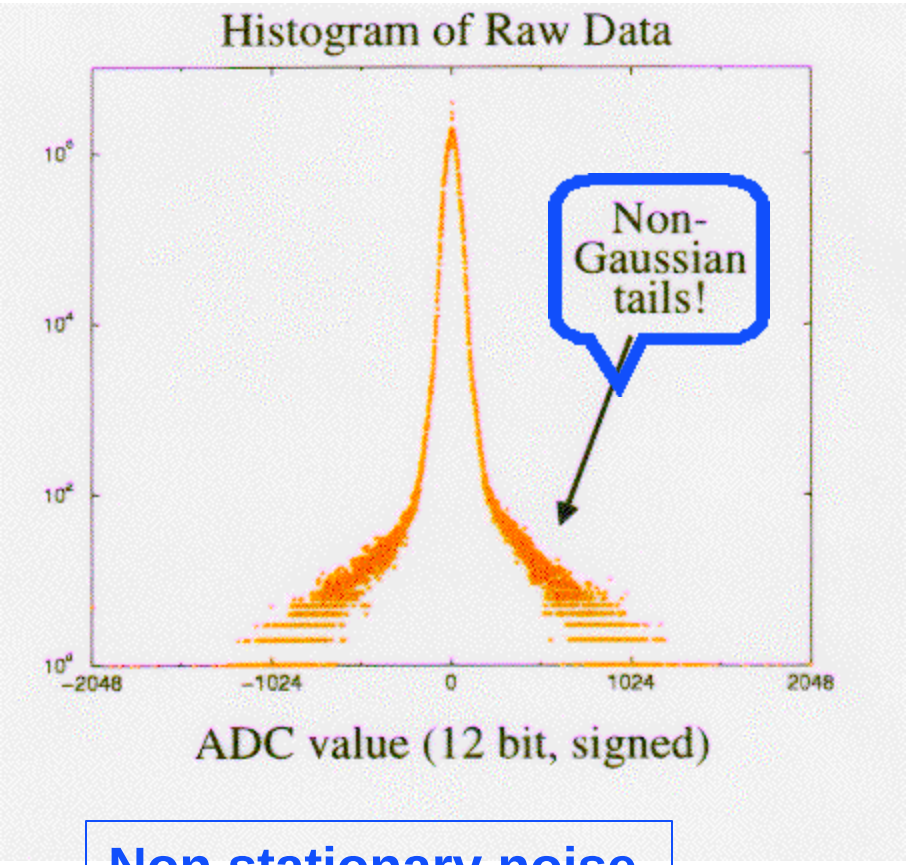


Test with real data by setting an upper limit on galactic neutron star inspiral rate using 40 m data

“Clean up” data stream



Effect of removing sinusoidal artifacts using multi-taper methods



Non stationary noise
Non gaussian tails

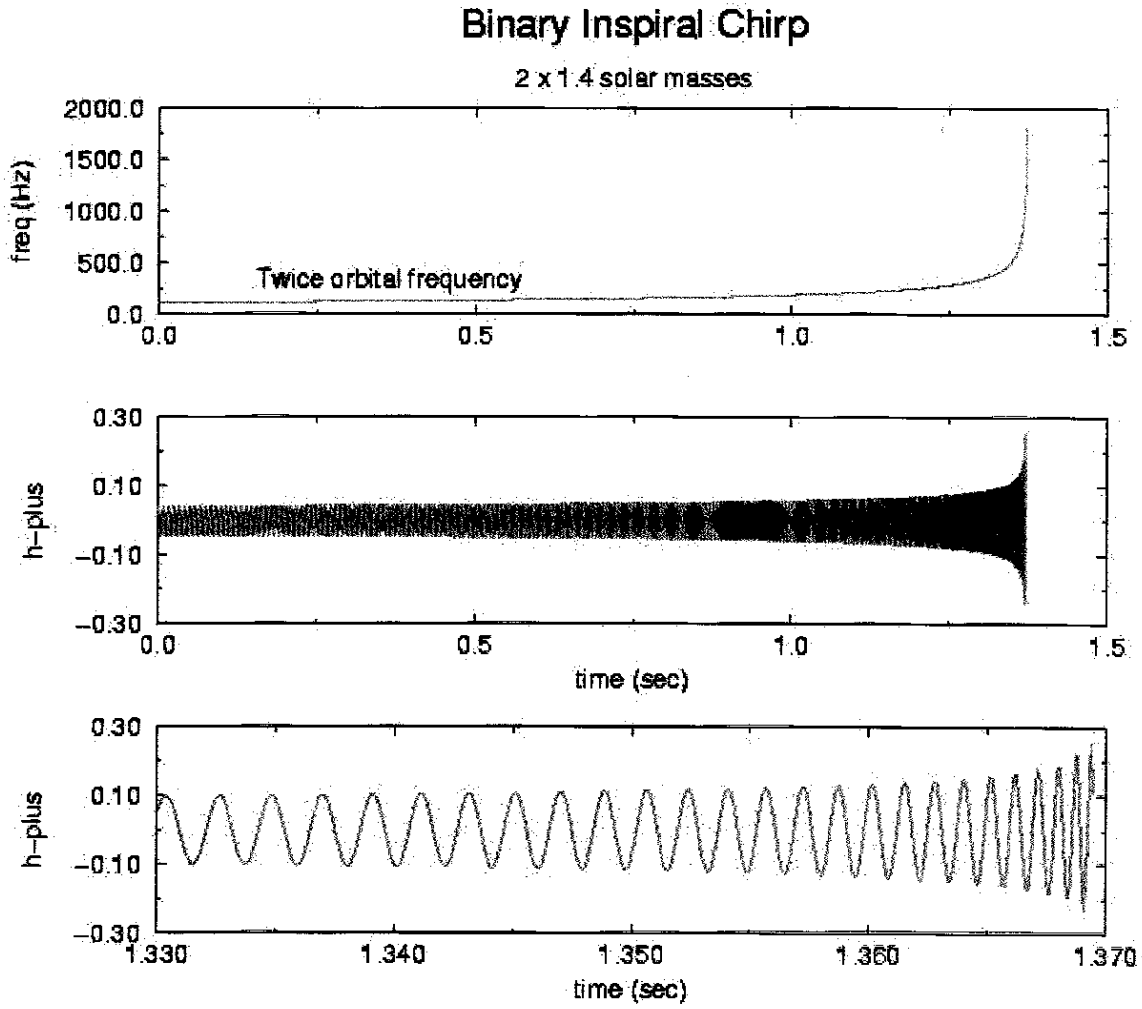
Inspiral ‘Chirp’ Signal

Template Waveforms

“matched filtering”
687 filters

44.8 hrs of data
39.9 hrs arms locked
25.0 hrs good data

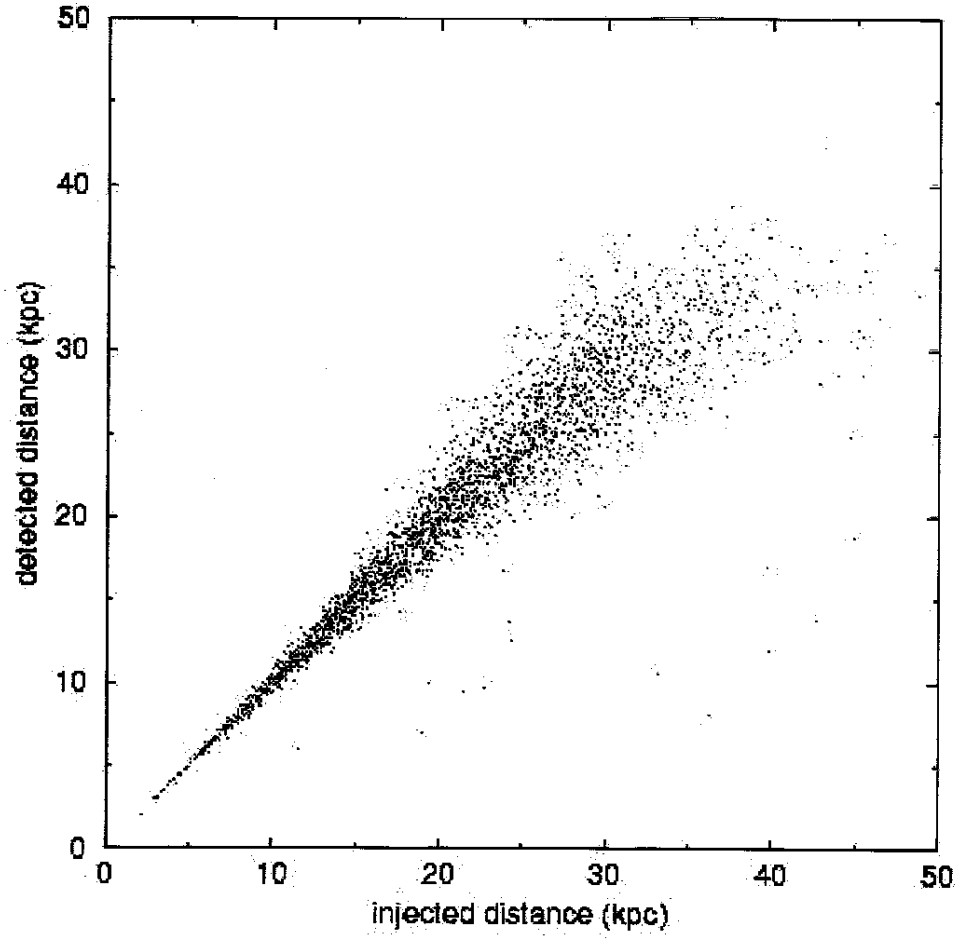
sensitivity to our galaxy
h **~ 3.5 10^{-19} $mHz^{-1/2}$**
expected rate ~10^{-6}/yr



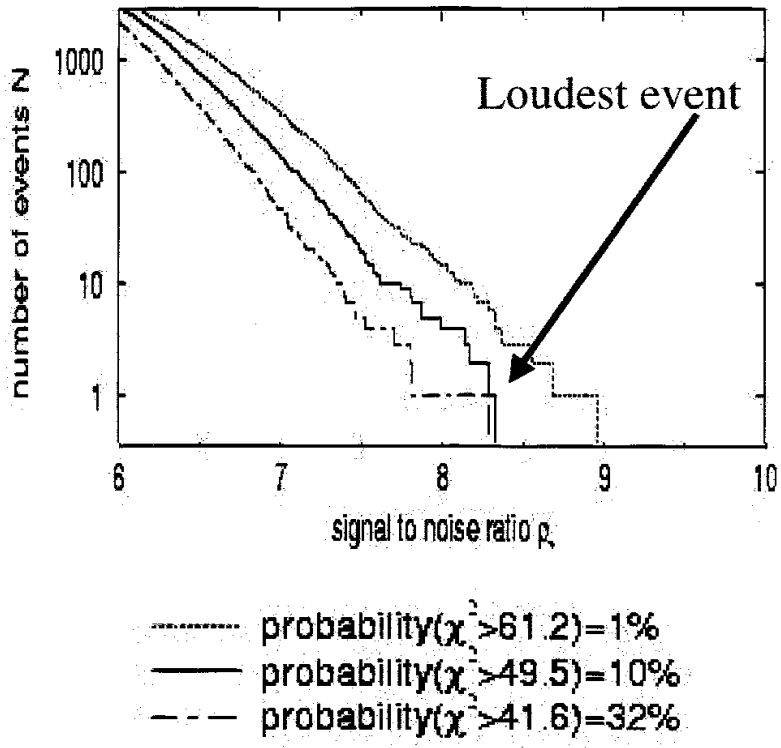
Detection Efficiency

- Simulated inspiral events provide end to end test of analysis and simulation code for reconstruction efficiency

- Errors in distance measurements from presence of noise are consistent with SNR fluctuations



Setting a limit



Upper limit on event rate can be determined from SNR of 'loudest' event

Limit on rate:

R < 0.5/hour with 90% CL

ε = 0.33 = detection efficiency

An ideal detector would set a limit:

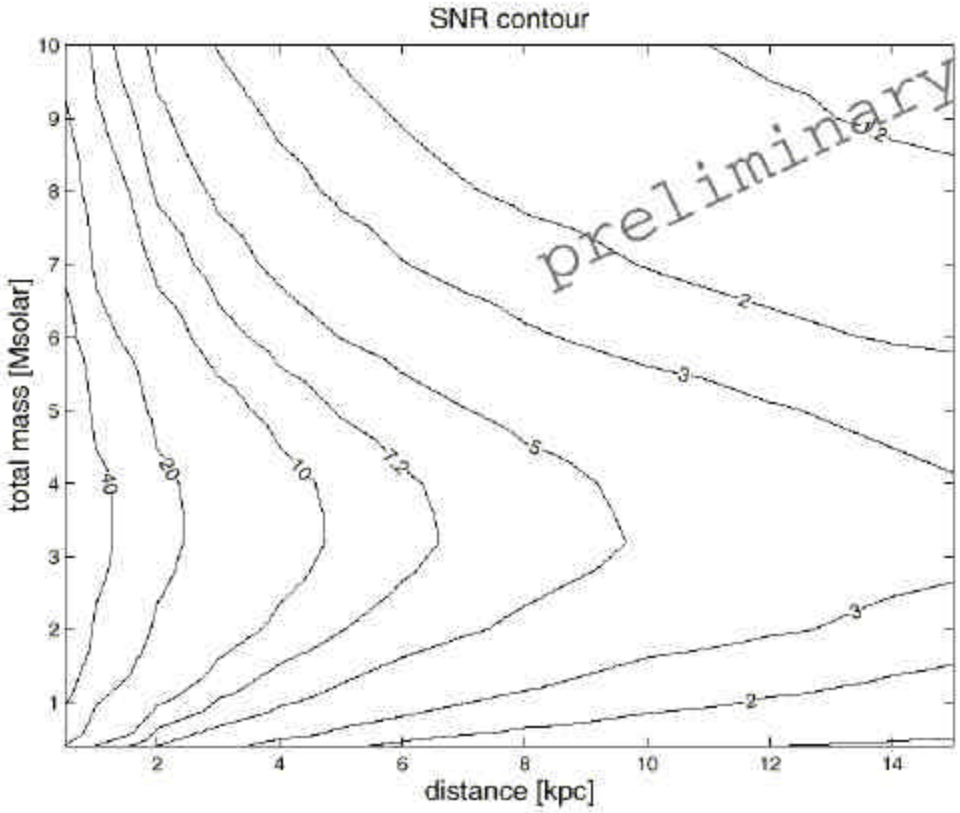
R < 0.16/hour

TAMA 300

search for binary coalescence

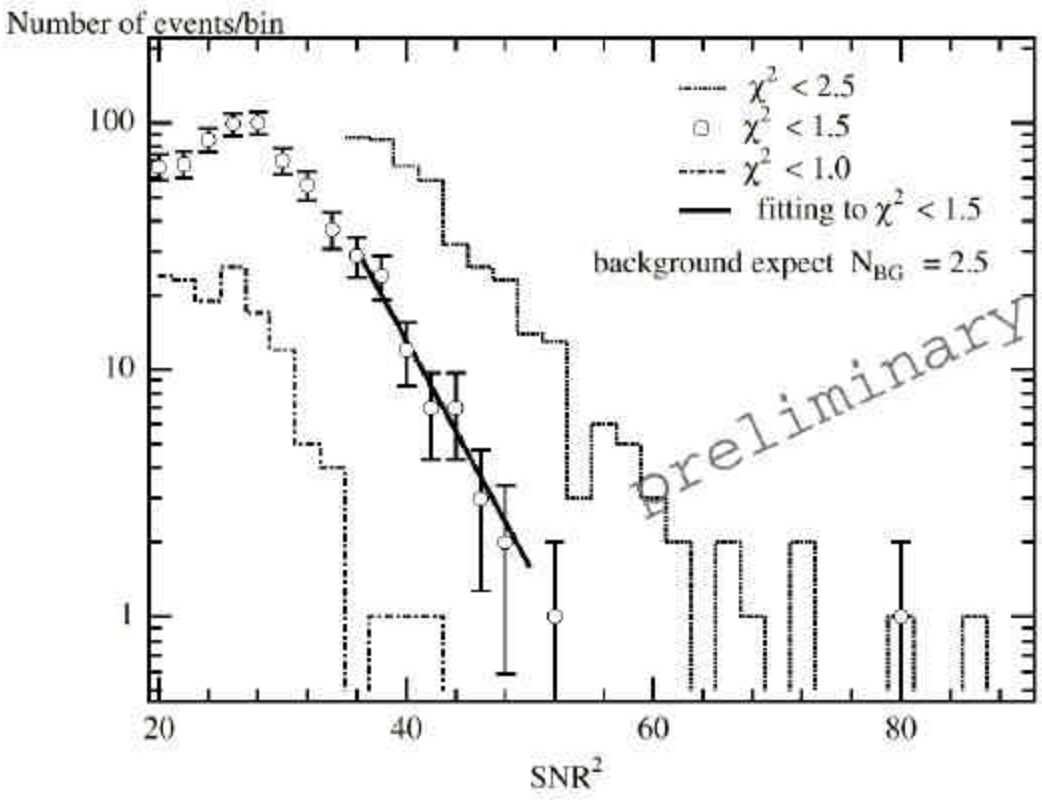
Matched templates

- 2-step hierarchical method
- chirp masses (0.3-10)M_0
- strain calibrated $\delta h/h \sim 1\ \%$



TAMA 300

preliminary result



For signal/noise = 7.2

Expect: 2.5 events
Observe: 2 events

Rate < 0.59 ev/hr 90% C.L.

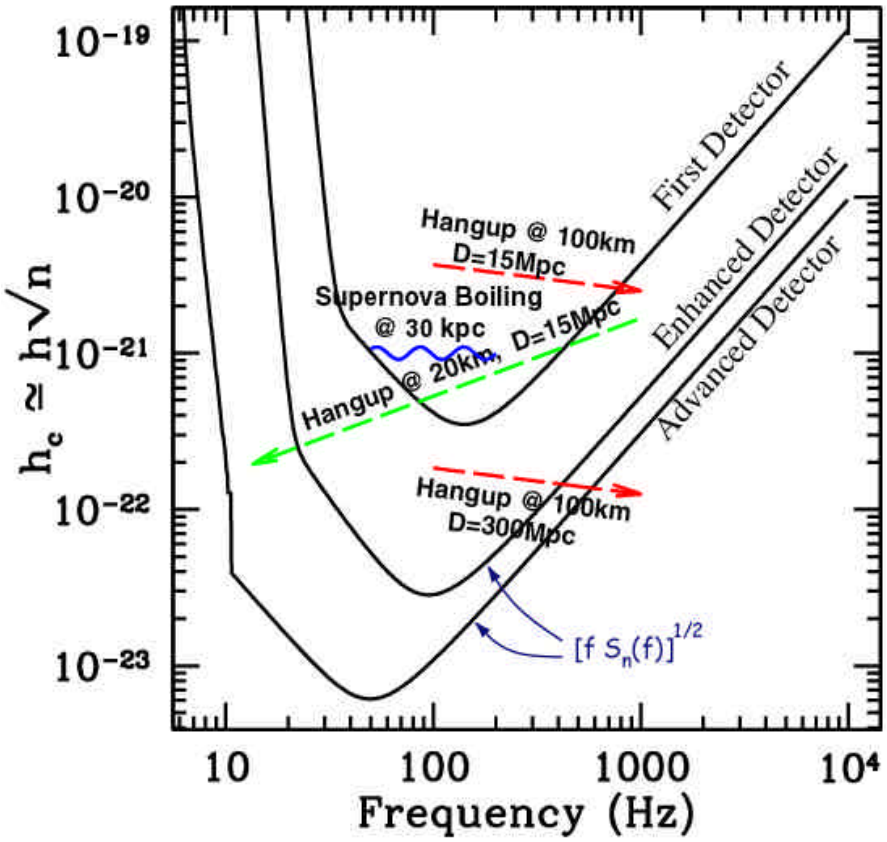
Note: for a 1.4 M_0 NS-NS inspiral this limit corresponds to a max distance = 6.2 kpc

Interferometers

astrophysical sources

SN1987A

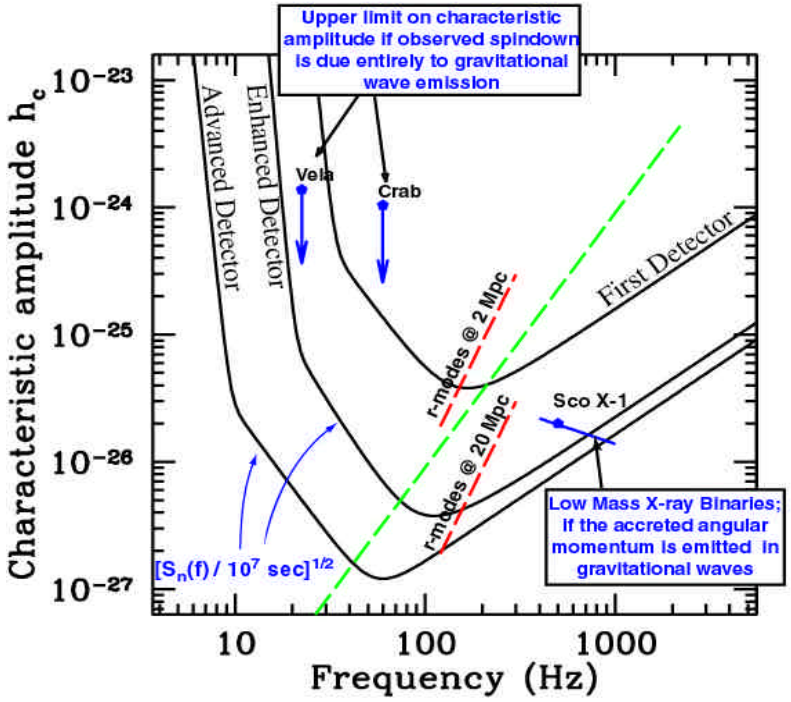
sensitivity to burst sources



LIGO

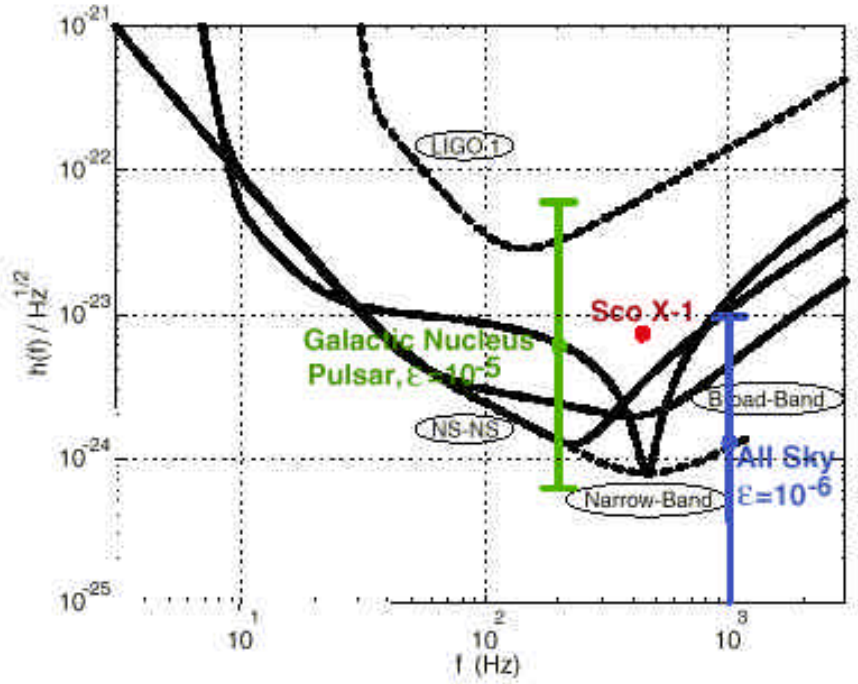
astrophysical sources

Continuous wave sources



Pulsars in our galaxy

- »non axisymmetric: 10-4 < e < 10-6
- »science: neutron star precession; interiors
- »narrow band searches best

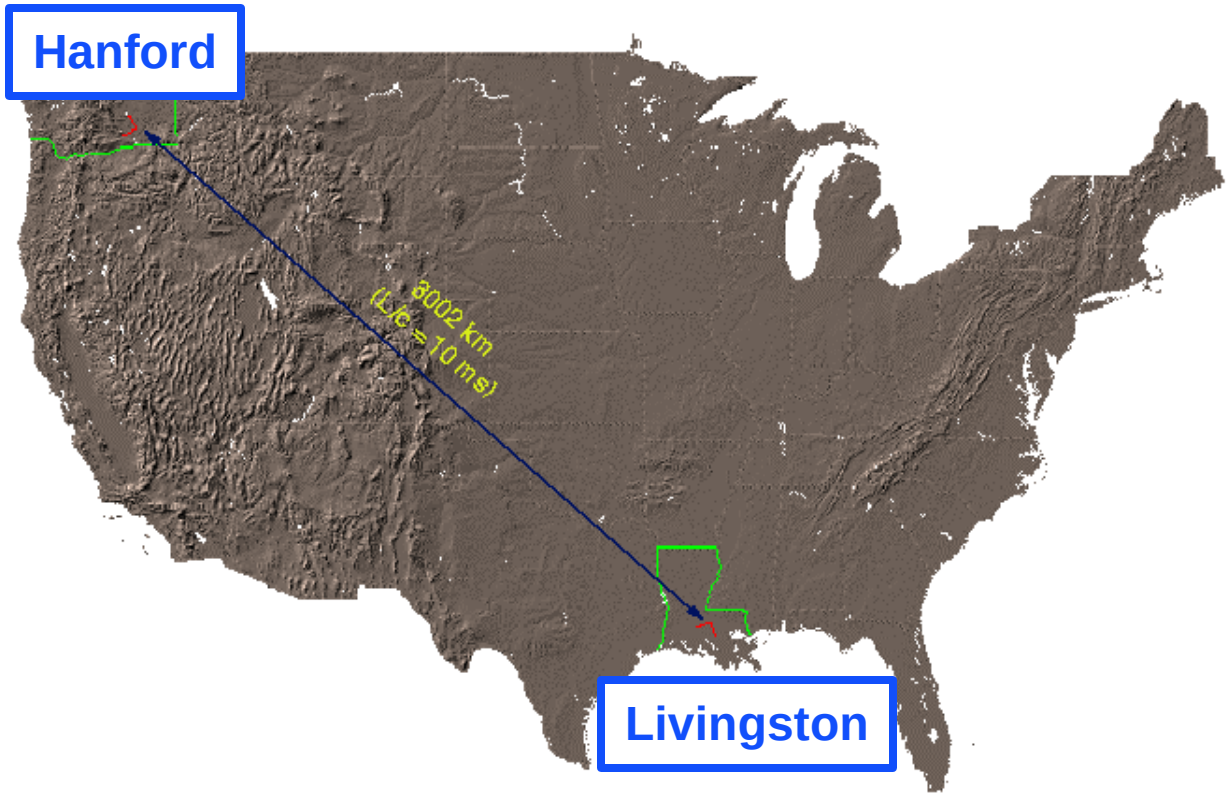


Conclusions

- a new generation of long baseline suspended mass interferometers are being completed with $h \sim 10^{-21}$
- commissioning, testing and characterization of the interferometers is underway
- data analysis schemes are being developed, including tests with real data from the 40 m prototype and TAMA
- science data taking to begin within two years
- plans and agreements being made for exchange of data for coincidences between detectors (GWIC)
- significant improvements in sensitivity ($h \sim 10^{-22}$) are anticipated about 2007+

Two Sites - Three Interferometers

- »Single Interferometer non-gaussian level ~50/hr
- »Hanford (Doubles) correlated rate (x1000) ~1/day
- »Hanford + Livingston uncorrelated (x5000) <0.1/yr



Coincidences between LLO & LHO
